LIST OF APPENDICES

ACKNOWLEDGEMENTS

Hecla Greens Creek Mining Company provided financial support and Greens Creek Mine environmental staff Chris Wallace, Dave Landes, and Mitch Brooks provided logistical support. Mr. Brooks provided the water quality data and Mr. Landes reviewed and edited the report. U.S. Forest Service Fishery Technician Christina Mounce and intern Victoria Simek assisted with sampling.

Several Division of Habitat staff assisted with this project. Habitat Biologist Kate Kanouse directed data collection and verified data entry and analyses, and Habitat Biologist Greg Albrecht processed the periphyton samples and verified the periphyton data. Matthew Kern of Alder Grove Farm identified benthic macroinvertebrates. Division of Habitat Operations Manager Dr. Al Ott and Habitat Biologist Kate Kanouse reviewed and edited the report, and Southeast Regional Supervisor Jackie Timothy reviewed and edited the Executive Summary.

Thank you all for your contribution.

EXECUTIVE SUMMARY

Since 2001, the Alaska Department of Fish and Game (ADF&G) has completed the aquatic biomonitoring studies the U.S. Forest Service (USFS) and Alaska Department of Environmental Conservation (ADEC) require for Hecla Greens Creek Mining Company's (Hecla) Greens Creek Mine. This partnership provides ADF&G the opportunity to gather and review data, and help identify, assess, and resolve issues that could affect aquatic resources near the mine site.

The aquatic studies include sampling periphyton, benthic macroinvertebrates, and juvenile fish in Greens Creek and Tributary Creek, two streams near mine development and operations. In 2017, we completed these studies at Greens Creek sites 48 and 54, and Tributary Creek Site 9.

The National Weather Service reports 2017 had 12% more rainfall (177 cm) and 23% less snowfall (169 cm) compared to the 30-year average, 1981–2010 (K. Vaughan, Observation Program Leader, National Weather Service, Juneau, personal communication).

Among the 2017 Greens Creek samples, mean chlorophyll *a* density at each site was the lowest observed since 2001, while mean benthic macroinvertebrate density and proportion of sensitive insects were within the ranges of values previously observed. At Tributary Creek Site 9, mean chlorophyll *a* density and mean benthic macroinvertebrate density were within the ranges of values previously observed, while the proportion of sensitive insects was similar to the 2016 results and among lowest proportions observed since 2001.

The 2017 Greens Creek Site 48 juvenile Dolly Varden char *Salvelinus malma* population estimate was similar to previous years, and the Greens Creek Site 54 juvenile Dolly Varden char population estimate was the third greatest observed. We did not capture juvenile coho salmon *Oncorhynchus kisutch* during the Site 54 population study, though we observed young-of-year coho salmon within the study reach. The 2017 Tributary Creek Site 9 juvenile Dolly Varden char population estimate was the second greatest observed and coho salmon continue to be the most abundant juvenile fish species. Mean fish condition of Dolly Varden char and coho salmon were similar to previous years.

Whole body Dolly Varden char element concentrations at all three sites were within the ranges previously observed. Comparing all three sites, Tributary Creek Site 9 samples tend to have greater element concentrations and variability than Greens Creek samples, except copper and zinc which were generally greater among Greens Creek Site 48 samples.

INTRODUCTION

The Greens Creek Mine is located about 29 km southwest of Juneau by air near Hawk Inlet on the west side of Admiralty Island, within the Tongass National Forest and the Admiralty Island National Monument (USFS 2013). The mine has operated since 1989, except between 1993 and 1996 when the mine was temporarily closed, and produces three concentrates containing silver, gold, zinc, and lead. Hecla, a subsidiary of Hecla Mining Company of Coeur d'Alene, Idaho, has owned and operated the mine since April 2008.

Most mine infrastructure is located in two drainages that support resident and anadromous fish: the dry-stack tailings disposal facility (TDF) at the headwaters of Tributary Creek, and the mill, mine facilities, and waste rock storage areas adjacent to Greens Creek (Figure 1).

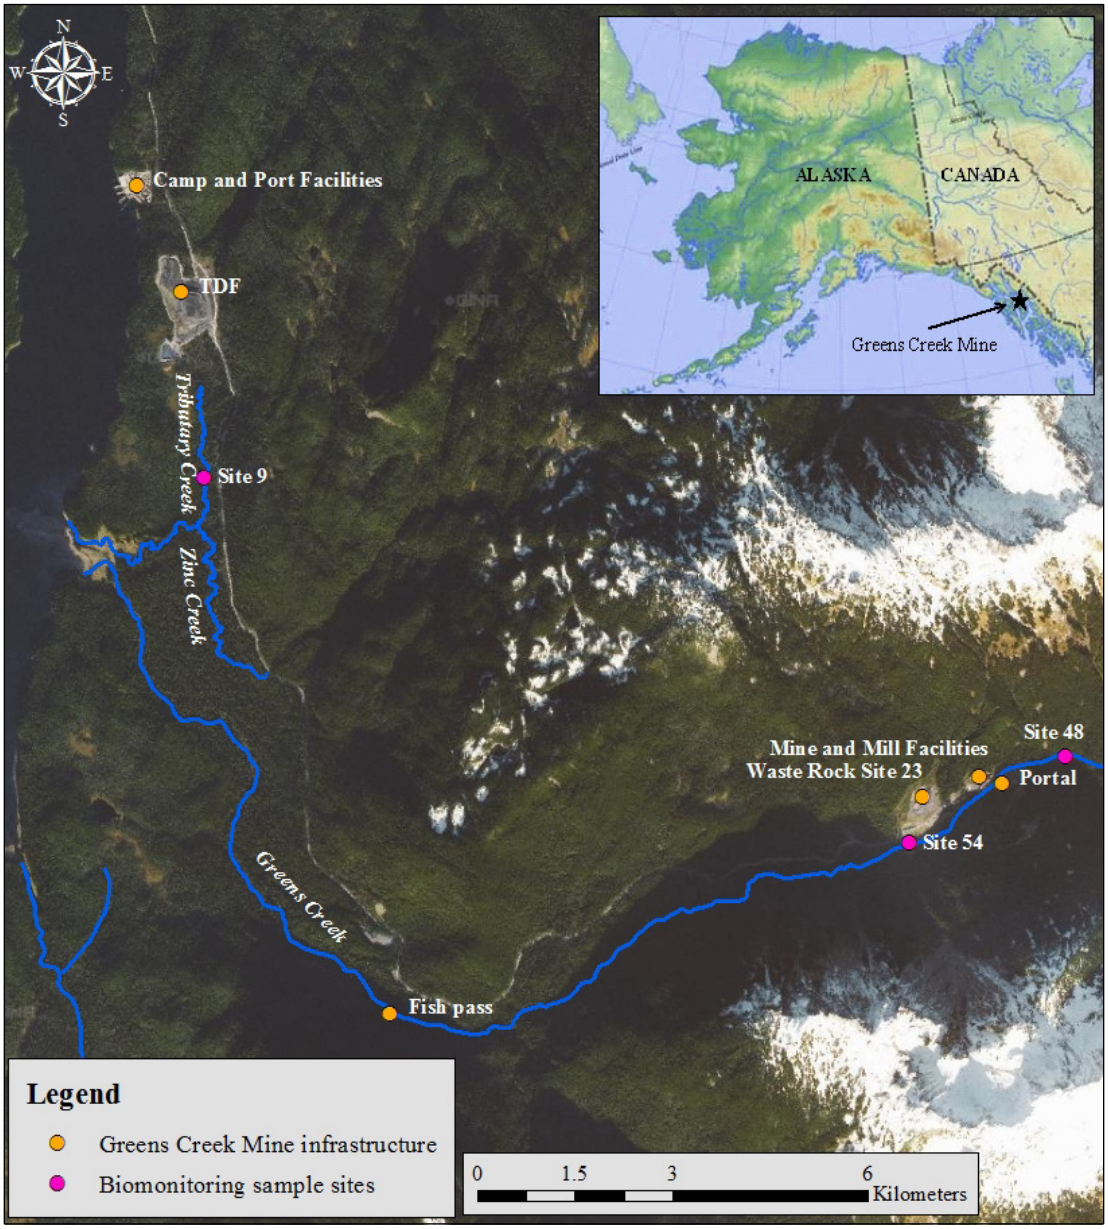

Figure 1.–Greens Creek Mine area map.

The project Plan of Operations Fresh Water Monitoring Program (FWMP; Hecla 2014, Appendix 1) and ADEC Waste Management Permit 2014DB0003 require aquatic studies in Greens Creek and Tributary Creek to document stream health near mine facilities.

The Division of Habitat began the aquatic studies for the Greens Creek Mine in 2001. Reports summarizing sampling results from previous years are in Weber Scannell and Paustian (2002), Jacobs et al. (2003), Durst and Townsend (2004), Durst et al. (2005), Durst and Jacobs (2006–2010), Kanouse (2011–2012), Kanouse and Brewster (2013–2014), Kanouse (2015), Brewster (2016), and Zutz (2017).

PURPOSE

This technical report summarizes the 2017 sample results and documents the condition of biological communities in Greens Creek and Tributary Creek near mine development and operations. This report satisfies the requirements for Hecla's approved Plan of Operations (Hecla 2014) and ADEC Waste Management Permit 2014DB0003.

AQUATIC BIOMONITORING

We completed the following studies:

- chlorophyll density and composition;
- benthic macroinvertebrate density and community composition;
- juvenile fish populations and fish condition; and
- whole body juvenile Dolly Varden char element concentrations.

STUDY AREA

We completed the aquatic studies at three sample sites:

1. Greens Creek Site 48, reference site upstream of mine activities;
2. Greens Creek Site 54, downstream of mine activities; and
3. Tributary Creek Site 9, downstream of the TDF.

We have sampled Site 48, Site 54, and Site 9 annually since 2001. We sampled a fourth site, Greens Creek Site 6, in 2001, 2006, and 2011 (Kanouse 2012).

Greens Creek

The Greens Creek watershed is about 22.3 km^2 (USGS 2018) and the main channel measures about 16 km long from the alpine headwaters to the mouth in Hawk Inlet. At each sample site, gradients range from 2% to 4%, cobble is the dominant substrate, and large woody debris is common. The creek is largely fed by snowmelt and other drainages, and the magnitude of peak discharge in early summer depends on snowpack. Rainfall events during the fall also cause peak discharges.

The lower 10 km of Greens Creek (Stream No. 112-65-10240) provides habitat for chum salmon *O. keta*, coho salmon, pink salmon *O. gorbuscha*, and Dolly Varden char (Johnson and Blossom 2017). ADF&G Division of Commercial Fisheries staff survey returning chum salmon in Greens Creek as part of their in-season assessment of chum salmon run strength (D. Harris, Juneau Area Commercial Fisheries Management Biologist, ADF&G, Juneau, personal communication).

Greens Creek stream flow data is recorded at USGS stream gage no. 15101490[a], located upstream of the mine portal and downstream of Hecla's infiltration gallery[b].

Greens Creek Site 48

Site 48 (Figure 2) is located upstream of all mine activities, except exploratory drilling, near 265 m elevation and about 0.8 km upstream of the mine portal. Reference data collected at Site 48 are compared to data collected downstream at Site 54. Resident Dolly Varden char is the only fish species we have documented at Site 48; the infiltration gallery concrete weir near the mine portal blocks upstream fish passage. Periphyton and benthic macroinvertebrate sampling occur in riffles about 30 m downstream of the fish sample reach.

Figure 2.–Greens Creek Site 48.

[a] Prior to February 16, 1999, the gage was located at a site 9 m upstream at datum 3 m higher (USGS 2018).
[b] Withdrawing water for mine and mill use.

Greens Creek Site 54

Site 54 (Figure 3) is located downstream of the Bruin Creek confluence and adjacent to waste rock storage Site 23, near 225 m elevation and about 1.8 km downstream of the mine portal. Data collected at Site 54 are compared to data collected at reference Site 48 to detect potential changes from waste rock storage areas, storm water ponds, and mine and mill facilities upstream. Between Site 48 and Site 54, there are three tributaries that drain to Greens Creek: 1350 Creek, Cub Creek, and Bruin Creek.

We have documented coho salmon, Dolly Varden char, and cutthroat trout *O. clarkii* at Site 54. Anadromous fish access the site via a fish pass about 5.6 km upriver from the mouth.[c] Periphyton and benthic macroinvertebrate sampling occur in riffles about 30 m upstream of the fish sample reach. Gallagher Creek enters Greens Creek within the fish sample reach.

Figure 3.–Greens Creek Site 54.

[c] In 1989, Greens Creek Mining Company installed an engineered fish pass as mitigation for impacts to Tributary Creek from the TDF. Three concrete weirs provide step pools for adult coho salmon passage through a natural bedrock chute that prevents upstream fish migration. In November 2005, flood flows damaged the fish pass during a heavy rainstorm and limited fish passage until Hecla repaired and strengthened the structure in March 2016.

Tributary Creek

The Tributary Creek watershed is about 1.7 km^2 (USFS 2013) and the main channel is about 1.6 km long to its confluence with Zinc Creek. The TDF occupies the original headwaters of the creek. Tributary Creek is a low-energy, lowland stream fed by groundwater, precipitation, and a few hillside drainages. Stream gradient varies 1–2%, organics and sand are the dominant substrates with gravel present near the mouth, and large and small woody debris are common. Discharge estimates based on field measurements and limited gage data suggest annual stream flows range 1–5 ft^3/s (USFS 2003).

Tributary Creek (Stream No. 112-65-10230-2007) provides habitat for coho salmon, pink salmon, and Dolly Varden char (Johnson and Blossom 2017).

Tributary Creek Site 9

Site 9 (Figure 4) is located about 1.2 km downstream of the TDF at 25 m elevation, and sampled to detect potential changes from the TDF. We have documented coho salmon, Dolly Varden char, cutthroat and rainbow trout *O. mykiss*, and sculpin *Cottus* sp. at this site. Periphyton and benthic macroinvertebrate sampling occurs within the fish sample reach after the juvenile fish population study is complete.

Figure 4.–Tributary Creek Site 9.

METHODS

We annually review data sets to ensure accuracy and consistency with methods modifications, and report corrections and updates in the document and appendices. The most recent technical report presents the current data sets and should be used to analyze data from previous years.

WATER QUALITY

Hecla staff used field meters to characterize basic water quality at each site during sampling, including temperature, pH, and conductivity. We include the 2017 results for each site in this report.

STREAM FLOW

Sampling and Analysis

We measured stream flow with a SonTek FlowTracker acoustic doppler velocimeter.[d] We attempted to record at least 20 measurement points in equidistant subsections and collected additional measurements where we observed changes in the stream bottom elevation and water velocity, except in Tributary Creek where we recorded as many measurements as practicable.

We strung a fiberglass measuring tape tightly across the stream perpendicular to flow and began the survey from either bank following methods described in SonTek (2007). We surveyed where stream flow was confined to one channel, and usually where the stream bottom elevation and stream flow were continuous across the channel.

Data Presentation

We present discharge[e] at the beginning of each sample site in the *Results* section.

PERIPHYTON: CHLOROPHYLL DENSITY AND COMPOSITION

Periphyton is composed of primary producing organisms such as algae, cyanobacteria and heterotrophic microbes, and detritus, attached to the submerged surfaces of aquatic ecosystems. Algal density and community structure are influenced by water and sediment quality through physical, chemical, and biological disturbances that change throughout the year (Barbour et al. 1999). The concentration of chlorophyll *a* (Chl-*a*) pigment in periphyton samples provides an estimate of active algal biomass (density), while concentrations of chlorophyll *b* (Chl-*b*) and chlorophyll *c* (Chl-*c*) estimate the composition of algal organisms present, such as green algae that produce chlorophyll *b*, and diatoms and brown algae that produce chlorophyll *c*.

Requirement FWMP 5.3

The FWMP requires measuring the density (mg/m^2) of chlorophylls *a*, *b*, and *c* in each periphyton sample, comparing the Greens Creek Site 48 Chl-*a* data to the Greens Creek Site 54 Chl-*a* data each year, and tracking change over time at each sample site. We do not have reference data to compare Tributary Creek Site 9 data.

---

[d] Prior to 2015 (Kanouse 2015), we measured stream flow using a Global Flow Probe Model FP101 flow meter and estimated discharge using a modification of the methods described in Platts et al. (1983).

[e] We present discharge data in Imperial units for convention.

Sample Collection and Analysis

We collected 10 smooth, flat, undisturbed, and perennially wetted rocks from submerged cobble in riffle habitats in less than 0.45 m water depth at each sample site, and submerged the rocks with the sample area facing up. We held a 5 × 5 cm square of high-density foam on the top of each rock and scrubbed the area around the foam with a toothbrush to remove algae and other organisms outside the sample area, then rinsed the rock by dipping it in the stream while holding the foam in place.

We placed a 47 mm diameter Type A/E 1 µm glass fiber filter into a Nalgene® filter holder attached to a vacuum pump with a gauge, removed the foam square, and scrubbed the sample area using a rinsed toothbrush into the filter holder. We used stream water in a wash bottle to rinse the loosened periphyton from the rock, the toothbrush, and the inside of the filter holder onto the filter. We repeated the scrub and rinse cycle a second time. We pumped most of the water through the filter, maintaining pressure less than 34 kPa, and added a few drops[f] of saturated magnesium carbonate solution[g] to the filter before pumping the sample dry. We removed the glass fiber filter, folded it in half with the sample on the inside, and wrapped it in a white coffee filter to absorb additional water. We placed the samples in a sealed, labeled plastic bag with desiccant and stored the samples in a light-proof cooler containing frozen icepacks during transportation, in a camp freezer while onsite, and in a –20 °C ADF&G Douglas laboratory freezer until processing.

We followed U.S. Environmental Protection Agency (USEPA 1997) protocol for chlorophyll extraction and measurement, determining instrument and estimated detection limits, and data analysis.[h] We removed the samples from the freezer, cut them into small pieces, and placed the filter pieces for each sample into individual 15 mL screw cap centrifuge tubes containing 10 mL of 90% acetone. We capped the centrifuge tubes and shook each sample vigorously[i] before placing them in a rack, covering them with aluminum foil, and storing them in a refrigerator overnight to extract the chlorophyll.[j] The following day, we centrifuged the samples for 20 min at 1,600 rpm, individually decanted the supernatant into a cuvette, and measured each sample absorbance at wavelengths 664 nm, 647 nm, 630 nm, and 750 nm using a Shimadzu UV-1800 spectrophotometer. Prior to measuring samples, we inserted two cuvettes with 90% acetone to correct for the absorbance of the solvent at each wavelength. We treated each sample with 80 µL of 0.1 N hydrochloric acid[k], waited 90 seconds, and measured absorbance at wavelengths 665 nm and 750 nm.

We entered sample absorbance values into trichromatic equations to estimate chlorophyll *a, b,* and *c* concentrations, and corrected for turbidity using the 750 nm absorbance value (APHA 2012, USEPA 1997). We corrected chlorophyll *a* concentrations when phaeophytin was detected. If chlorophyll *a* was not detected in a sample, we report the concentration at the estimated detection limit and do not report values for chlorophylls *b* or *c*. We round all values to

---

[f] This measurement is not exact as the amount of water and magnesium carbonate used to create a saturated solution varies. We used supernatant solution to avoid magnesium carbonate solids.

[g] To prevent acidification and conversion of chlorophyll to phaeophytin.

[h] Except we stored the samples longer than 3.5 weeks and we cut the sample filters, rather than homogenize them, to reduce acetone exposure for laboratory staff.

[i] To ensure all filter pieces were submerged.

[j] We allowed samples to steep for at least 2 h and not more than 24 h.

[k] To convert the chlorophyll to phaeophytin.

2 decimal places. The 2017 chlorophyll *a* concentration estimated detection limit was 0.19 mg/m^2.

We performed the nonparametric Kruskal-Wallis one-way analysis of variance by ranks test, using Statistix® 9 analytical software, to test for differences of mean ranks between the 2017 Greens Creek sites 48 and 54 data, and across years at each site (Neter et al. 1990). We used the all-pairwise comparison test to identify differences between years and report significant differences when $p \leq 0.05$.

Data Presentation

We present a figure of Greens Creek mean daily discharges three weeks prior to sampling in 2017 and include daily discharge means for the same period 2001–2016.[l] We also include a figure presenting the range of Greens Creek mean daily discharges three weeks prior to sampling, 2001–2017.

For each sample site, we present a figure of mean chlorophyll *a* density (mg/m^2) ± 1 SD, excluding potential outliers. A star (∗) in the figure represents a potential outlier, where chlorophyll *a* density of the sample exceeded the mean for the typical range of data that year by more than three times. We include possible outlier values in calculations, statistical analyses, and the raw data set (Appendix A).

We compare chlorophyll *a* density and chlorophyll proportions by year among Greens Creek sites 48 and 54 in *Comparisons Among Greens Creek Sites*. We do not compare Greens Creek data with Tributary Creek data as these systems provide different habitats for aquatic life, which affect productivity.

Benthic Macroinvertebrate Density and Community Composition

Benthic macroinvertebrates (BMI) classified in the orders Ephemeroptera (mayflies), Plecoptera (stoneflies), and Trichoptera (caddisflies), collectively known as EPT taxa, have complex and short life cycles and many genera are sensitive to changes in water and sediment quality (Barbour et al. 1999). These organisms are secondary producers, feed on periphyton and other macroinvertebrates, and provide an important food source for fish.

Requirement FWMP 5.4

The FWMP requires evaluating BMI community composition and abundance by sample at each site each year. We estimate mean BMI density and community composition at each site, compare the annual Greens Creek sites 48 and 54 data, and track change over time at all sites. We do not have reference data to compare Tributary Creek Site 9 data.

Sample Collection and Analysis

We opportunistically collected 8 BMI samples[m] from each site using a Hess sampler in riffles and runs with cobble substrate and different flow velocities—habitat with the greatest taxonomic density and richness (Barbour et al. 1999). We do not sample other habitat types (e.g. pools) to reduce variability of the data.

---

[l] Discharge data are not available for Tributary Creek.

[m] Prior to 2015, we collected 5 BMI samples each year.

The Hess stream bottom sampler has a 0.086 m^2 sample area and material is captured in a 200 mL cod end, both constructed with 300 µm mesh. We pushed the sampler into the stream bottom, scrubbed rocks within the sample area with a brush, and disturbed gravels, sand, and silt to about 10 cm depth to dislodge macroinvertebrates into the net.[n] We rinsed the net in the stream to ensure all organisms floated into the Hess sampler cod end, transferred each sample from the cod end to a labeled 500 mL plastic bottle, and preserved the samples in 95% ethanol at a ratio of three parts ethanol to one part sample. We discarded all samples where sediment overfilled the cod end.

Contractor Matt Kern of Alder Grove Farm used an elutriator system and 0.5 mm and 0.3 mm sieves to sort macroinvertebrates from debris,[o,p] and identified BMIs to the lowest practical taxonomic level[q] using Merritt and Cummins (1996) and Stewart and Oswood (2006). Habitat Biologist Greg Albrecht provided quality control by verifying BMI identification of three samples.

We calculated BMI density (per m^2) for each sample by dividing the number of BMIs by 0.086 m^2, the Hess sampling area. We estimated BMI density for each site by calculating the mean density among the 8 samples. We report taxa richness as the number of taxonomic groups identified to the lowest practical level and exclude terrestrial organisms[r] from all calculations.

Data Presentation

For each sample site, we present a figure of mean BMI density ± 1 SD and a figure illustrating community composition. Annual data summaries are included in Appendix B.

We compare annual BMI density and taxa richness data among Greens Creek sites 48 and 54 in *Comparisons Among Greens Creek Sites*. We do not compare Greens Creek data with Tributary Creek data as these systems provide different habitats for aquatic life, which affect productivity.

JUVENILE FISH POPULATION

Requirement FWMP 5.5

The FWMP requires estimating juvenile fish populations by species at each site, comparing the Greens Creek sites 48 and 54 population data each year, and monitoring population change over time at all sample sites. Valid population estimates are subject to our ability to satisfy assumptions of the study design each year.

---

[n] We spend about the same amount of time collecting each sample (e.g. 5 minutes) and prefer to have the same person collecting all samples at each site for consistency.

[o] Gordon Willson-Naranjo and Greg Albrecht, Habitat Biologists, to Jackie Timothy, Southeast Regional Supervisor, ADF&G Division of Habitat. [q] Insects of the orders Ephemeroptera, Plecoptera, Trichoptera, and Diptera to genus, except nonbiting midges to family Chironomidae, and all others to class or order.

[r] Including adult terrestrial insects of the orders Ephemeroptera, Plecoptera, Trichoptera, and Diptera.

Sample Collection and Analysis

We sampled 50 m reaches isolated by natural features, such as shallow riffles and debris jams, using two-piece 6.35 mm galvanized steel minnow traps baited with disinfected salmon roe[s] following methods described in Magnus et al. (2006). We placed rocks in the bottom of each trap to weight the trap down and provide refuge for captured fish. We used bait contained in a punctured plastic bag to prevent ingestion and reduce the possibility of sample contamination. Prior to each study, we opportunistically set several baited minnow traps within 15 m of the upstream and downstream sample reach boundaries to capture potential migrants and improve sample reach isolation.[t] These minnow traps remained undisturbed during the study, and upon study completion, we recorded fish captured by species and released fish at capture sites. We did not include fish captured in these boundary traps in the population estimates.

We sampled juvenile fish populations using a modification[u] of a depletion method described by Bryant (2000). Beginning at the downstream end of each reach, we opportunistically set baited minnow traps in all habitat types where water depth and flow allowed. We moved away from the sample site as practicable[v] to avoid disturbing fish while the traps soaked for 1.5 h. We retrieved each trap, transferred captured fish to a plastic bucket containing aerated stream water, removed the used bait bag, rebaited, and reset each trap in the same location as quickly as possible. We allowed the trap to soak another 1.5 h, and completed the sequence a third time.

We processed captured fish between passes. Biologists anesthetized fish using 9 mg/L AQUI-S 20E (10% eugenol), measured and recorded FL to the nearest 1 mm, weight to the nearest 0.1 g, and species (Pollard et al. 1997). Prior to weighing each fish, we tared the scale and emptied the measuring tray to minimize water weight. We retained fish in a perforated plastic bucket secured in the creek and released captured fish[w] to the sample reach upon study completion.

We collected data to meet the assumptions of closure and equal probability of capture (Lockwood and Schneider 2000) during the three passes by ensuring the following:

- Fish emigration and immigration during the sampling period was negligible.
    - Sample reaches were isolated by natural stream features, and we set traps upstream and downstream of sample reaches to capture potential migrants.
- All fish were equally vulnerable to capture during each pass.
    - We set traps in all habitat types where water depth and flow allowed.
- Fish did not become more wary of capture with each pass.
    - We maintained trap numbers and placement during all three passes.
    - We completed all three passes as quickly as possible.
    - To avoid disturbing fish, we moved away from sample reaches while the traps soaked.

---

[s] We added 4 oz. of Betadyne® for every 3 gallons of water and allowed roe to soak for 15 minutes, stirring frequently.

[t] Greens Creek discharge is usually too high to efficiently and effectively isolate sample reaches using a 6.35 mm (0.25 in) mesh net across the stream. Though a mesh net could effectively isolate the Tributary Creek Site 9 sample reach, we also used baited minnow traps.

[u] We sampled shorter reaches, used more minnow traps, and completed three passes instead of four.

[v] Location dependent on our ability to visually monitor the traps and potential bear interference.

[w] Except, we retained 10 Dolly Varden char for whole body element concentrations at each sample site.

- Collection effort and conditions which affect collection efficiency remained constant.
    - We retrieved traps beginning at the downstream end of each reach.
    - We moved upstream setting, retrieving, and replacing traps as quickly as possible.
    - We timed each pass exactly 1.5 h.
    - We replaced used bait bags with fresh bait bags and reset each trap in the same location.

We estimated juvenile fish populations using the multiple-pass depletion method developed by Lockwood and Schneider (2000), based on methods developed by Carle and Strub (1978). The repetitive method produces a maximum likelihood estimate (MLE) of fish with a 95% CI.

Let X represent an intermediate sum statistic where the total number of passes, k, is reduced by the pass number, i, and multiplied by the number of fish caught in the pass, C_i, for each pass:

$$X = \sum_{i=1}^{k} (k - i) C_i$$

Let T represent the total number of fish captured in the minnow traps, all passes. Let n represent the predicted population of fish, using T as the initial value tested. Using X, we calculated the MLE, N, by repeated estimations of n. The MLE is the smallest integer value of n greater than or equal to T which satisfies[x] the following:

$$\left[\frac{n+1}{n-T+1}\right] \prod_{i=1}^{k} \left[\frac{kn - X - T + 1 + (k-i)}{kn - X + 2 + (k-i)}\right]_i \leq 1.000$$

The probability of capture, p, is given by the total number of fish captured, divided by an equation where the number of passes is multiplied by the MLE and subtracted by the intermediate statistic, X,

$$p = \frac{T}{kN - X}$$

The variance of N, a measure of variability from the mean, is given by:

$$Variance\ of\ N = \frac{N(N-T)T}{T^2 - N(N-T)\left[\frac{(kp)^2}{(1-p)}\right]}$$

We determined the SE of N by calculating the square root of the variance of N, and the 95% CI for the MLE using ± 2(SE). The size of the 95% CI depends on the number of captures each pass; a small 95% CI results when fewer captures steadily occur with each pass, and a large 95% CI results when captures do not steadily decrease and when the number of fish captured on the second or third pass exceed the number of fish captured on the previous pass. A MLE cannot be generated from samples from small populations if we capture few fish (e.g. ≤ 20) during the

[x] Lockwood and Schneider (2000) suggest the result should be rounded to one decimal place (1.0). We use three decimal places (1.000) which is an option in Carle and Strub (1978).

three passes; in these cases, we present the number of fish captured as the result and do not include a MLE.

Calculating a MLE using three-pass depletion data relies on equal capture probability among passes (Bryant 2000, Carle and Strub 1978, Lockwood and Schneider 2000). To evaluate equal capture probability, we used the goodness of fit test (White et al. 1982) recommended by Lockwood and Schneider (2000), which follows the χ^2 test form. We first calculated expected numbers of fish captured for each pass ($C_1, C_{2.}, C_3$) using variables previously described:

$$E(C_1) = N(1-p)^{i-1}p$$

Then we calculated χ^2,

$$\chi^2 = \frac{[\mathrm{C_1} - \mathrm{E(C_1)}]^2}{\mathrm{E(C_1)}} + \frac{[\mathrm{C_2} - \mathrm{E(C_2)}]^2}{\mathrm{E(C_2)}} + \frac{[\mathrm{C_3} - \mathrm{E(C_3)}]^2}{\mathrm{E(C_3)}}$$

We compare the χ^2 test result against $\chi^2_{0.95}$ with one degree of freedom (Lockwood and Schneider (2000), and if the χ^2 value is lower, the goodness of fit test suggests we achieved equal capture probability; if not, the MLE will be biased low.

Data Presentation

For each sample site, we present a figure of juvenile fish population estimates by species each year. We also present a comparison of Greens Creek sites 48 and 54 population estimates over time in *Comparisons Among Greens Creek Sites.* We do not compare Greens Creek data with Tributary Creek data as these systems provide different habitats for aquatic life, which affect productivity. Capture data summaries and length frequency diagrams of captured fish are included in Appendix C.

JUVENILE FISH CONDITION

Age, sex, season, maturation, diet, gut contents, fat reserve, and muscular development affect fish condition. We used juvenile fish length and weight data to calculate fish condition, an index of fish health.

Requirement FWMP 5.5

The FWMP requires we report mean fish condition by species each year.

Sample Collection and Analysis

We used FL and weight data of fish captured during the juvenile fish population studies, excluding fish measuring less than 40 mm FL. We calculated Fulton's condition factor (*K*) using the equation given in Anderson and Neumann (1996), where the weight (*W*) of each fish is divided by the cubed length (*L*) of the fish, and the product multiplied by 100,000,

$$K = \frac{W}{L^3} \times 100{,}000$$

Data Presentation

For each sample site, we present mean fish condition by species, compare fish condition among Greens Creek sites 48 and 54 in *Comparisons Among Greens Creek Sites*, and include mean condition by species by site and year in Appendix C.

JUVENILE FISH ELEMENT CONCENTRATIONS

Requirement FWMP 5.6

The FWMP requires we annually sample[y] 10 juvenile Dolly Varden char within the size range 85–125 mm FL for whole body concentrations of silver (Ag), cadmium (Cd), copper (Cu), mercury[z] (Hg), lead (Pb), selenium (Se), and zinc (Zn) at each site. A 85 mm fish provides the minimum amount of tissue (about 5 g) required for laboratory analyses, while the maximum fish size of 125 mm improves the likelihood of sampling less than 3-year-old fish at sites 54 and 9 where anadromous Dolly Varden char may be present. We evaluate the data for each site over time and compare the data among all three sites each year.

Sample Collection and Analysis

We wore latex gloves when handling fish and retained 10 juvenile Dolly Varden char measuring 85–125 mm FL captured during the juvenile fish population survey. We retained fish in individually labeled plastic bags, and measured FL and fish weight, correcting for bag weight. We placed all samples from each site in a larger plastic bag labeled with the sample location. We stored the samples in a cooler containing frozen ice packs during transport, in a camp freezer while onsite, and in a –20 °C ADF&G Douglas laboratory freezer.

We shipped the samples in a cooler with frozen ice packs to ALS Environmental in Kelso, WA, and maintained written chain of custody documentation. ALS Environmental individually digested, dried, and analyzed each sample for total Ag, Cd, Cu, Hg, Pb, Se, and Zn on a dry weight basis following EPA method 1631E (Mercury in Water by Oxidation, Purge and Trap, and Cold Vapor Atomic Fluorescence Spectrometry) for Hg, and EPA method 6020A (Inductively Coupled Plasma – Mass Spectrometry) for the other elements. ALS Environmental provided Tier II quality assurance/quality control information including results for matrix spikes, sample blanks, sample duplicates, and standard reference materials.

We performed the nonparametric Kruskal-Wallis one-way analysis of variance by ranks test, using Statistix® 9 analytical software, to test for equality of population medians between sites (Neter et al. 1990). We used the all-pairwise comparison test to identify differences between sites, and report significant differences when $p \leq 0.05$.

Data Presentation

For each sample site, we present a figure of maximum, median, and minimum whole body concentrations (mg/kg) for each element by year. We also compare the data among sample sites in *Comparison Among Sites*. We include the raw data, presenting the mean value for duplicate sample results, and the laboratory report in Appendix D.

---

[y] Prior to 2015, we collected 6 Dolly Varden char samples at each site.

[z] We began annually testing for Hg in 2012, and incidentally received Hg data in 2010.

RESULTS

Greens Creek mean daily discharges three weeks prior to sampling in 2017 were generally greater than the previous 16 year average, and the median daily discharge during the three week period was greater than many previous sampling years (USGS 2017; Figures 5, 6).

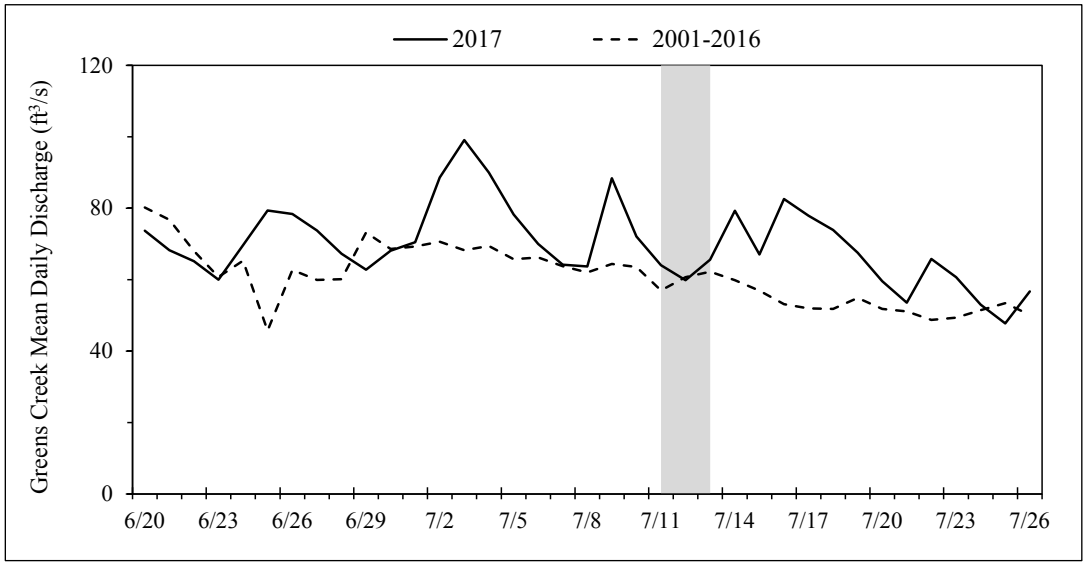

Figure 5.–Greens Creek mean daily discharge three weeks prior to sampling in 2017.
Note: 2017 sampling days highlighted in gray.
Source: USGS Gage 15101490 (USGS 2017).

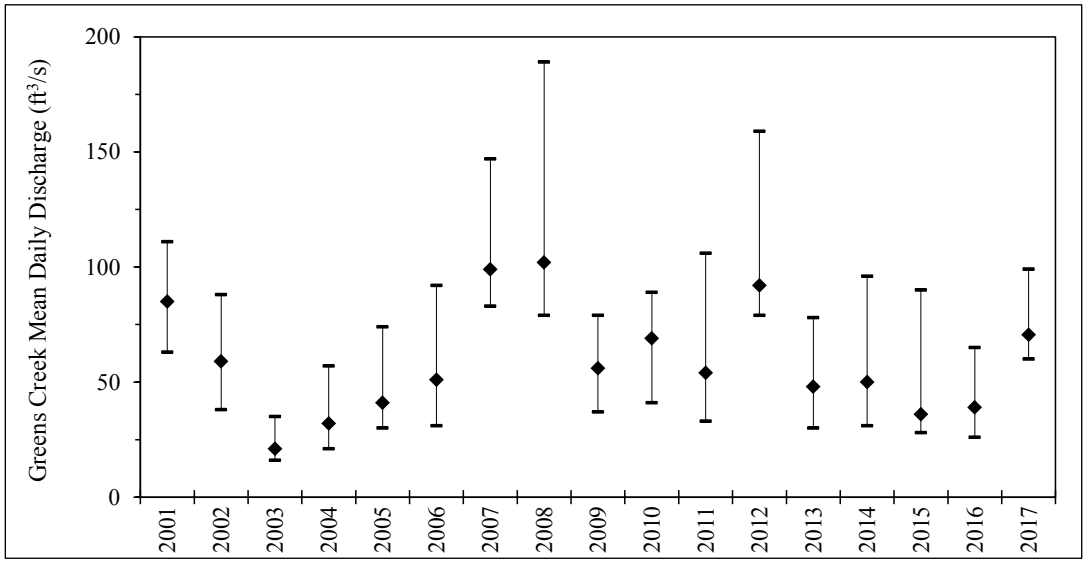

Figure 6.–Greens Creek mean daily discharges three weeks prior to sampling, 2011–2017.
Note: Median, minimum, and maximum discharges presented.
Source: USGS Gage 15101490 (USGS 2017).

GREENS CREEK SITE 48

We sampled Greens Creek Site 48 on July 13, 2017. Hecla environmental staff measured basic water quality data at 0830: water temperature 7.5 °C, conductivity 94.26 µS/cm, and pH 7.76. We measured stream flow in a single channel below the sandbar where we process fish and estimate discharge was 49 ft^3/s at 1445. The USGS stream gage located downstream of Site 48, 1350 Creek, Cub Creek, and Hecla's water withdrawal recorded 62.4 ft^3/s at 1500. We observed more stream flow through the river-left side of the large woody debris jam, similar to last year.

Periphyton: Chlorophyll Density and Composition

The 2017 mean chlorophyll *a* density was 1.20 mg/m^2, the lowest mean density observed since 2001 and similar to the 2012 mean density (Figure 7).[aa] The samples contained about 89% chlorophyll *a*, 11% chlorophyll *c*, and no chlorophyll *b*, similar to mean composition in previous years.

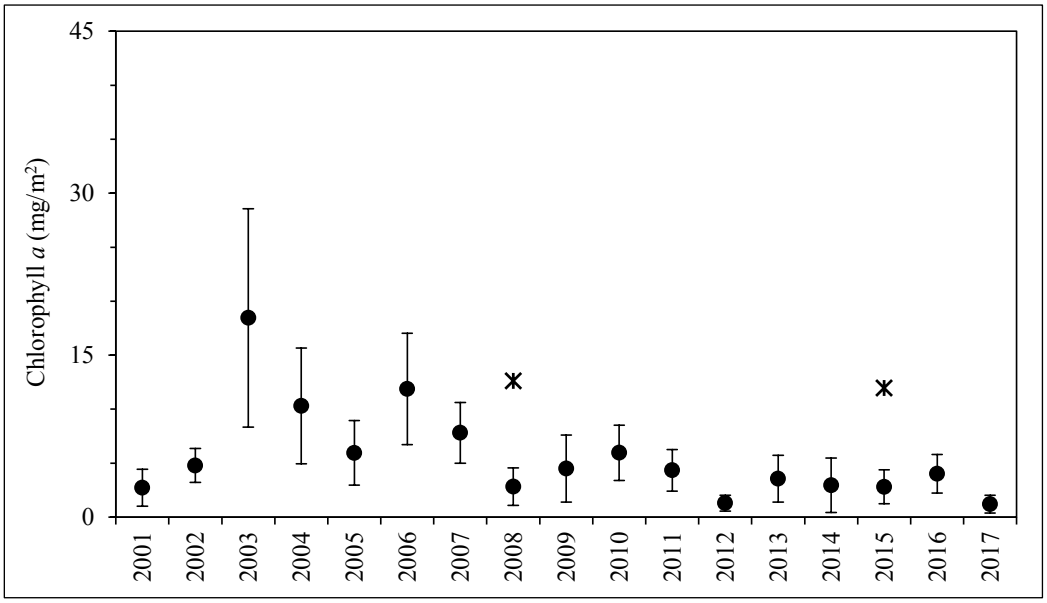

Figure 7.–Greens Creek Site 48 chlorophyll *a* densities.
Note: Mean density ± 1 SD, excluding potential outliers (∗).

Benthic Macroinvertebrate Density and Community Composition

Among the 2017 BMI samples, we counted 25 taxa and estimate mean density at 2,346 BMI/m^2, of which 90% were EPT insects, similar to previous years (Figures 8, 9). Dominant taxa were Ephemeroptera: *Epeorus* and *Baetis*, representing 24% and 16% of the samples.

[aa] We usually find significant differences in Site 48 chlorophyll *a* densities between the current year and the 2003 and 2006 data. Chlorophyll *a* densities in 2003 and 2006 were the greatest observed since 2001, which we attribute to natural variation.

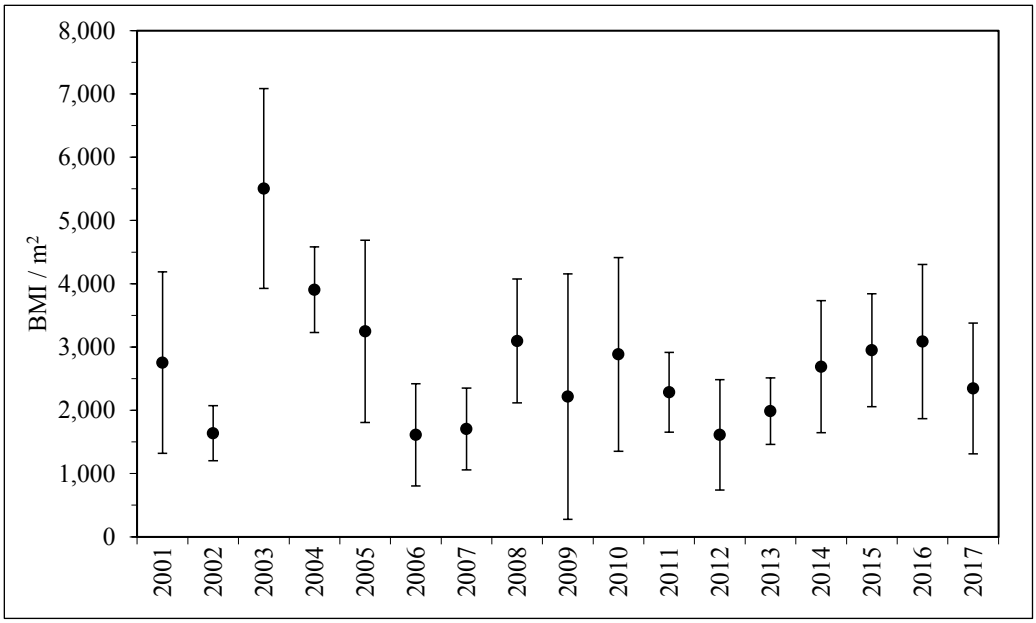

Figure 8.–Greens Creek Site 48 benthic macroinvertebrate densities.
Note: Mean density ± 1 SD.

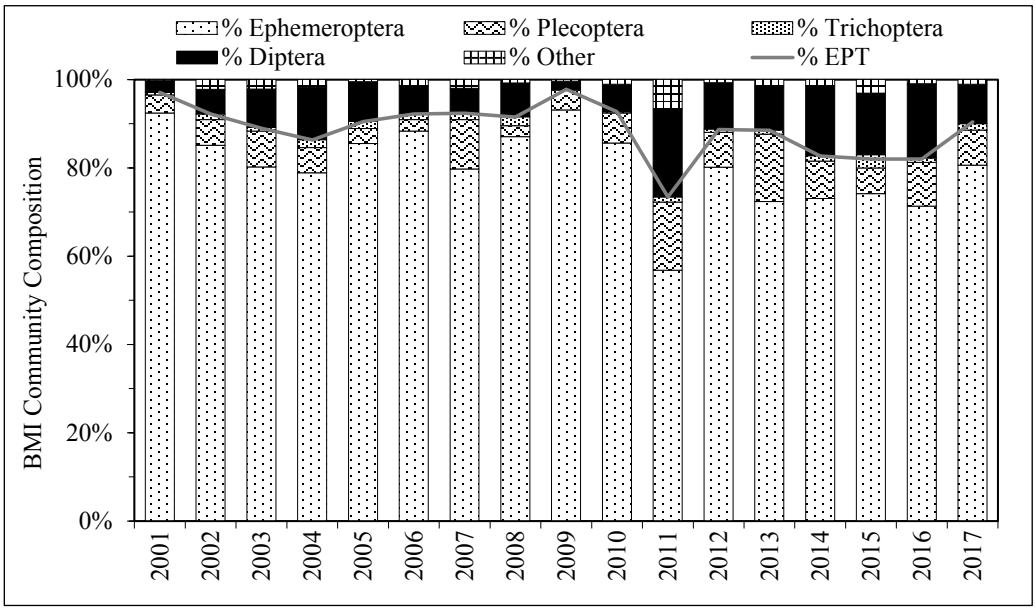

Figure 9.–Greens Creek Site 48 benthic macroinvertebrate community composition.

Juvenile Fish Populations and Fish Condition

We estimate the 2017 Dolly Varden char population at 139 ± 8 fish, within the range of previous estimates (Figure 10). Mean fish condition among the 132 Dolly Varden char we captured was 1.1, and the length frequency diagram suggests multiple age classes were present, as in previous years.

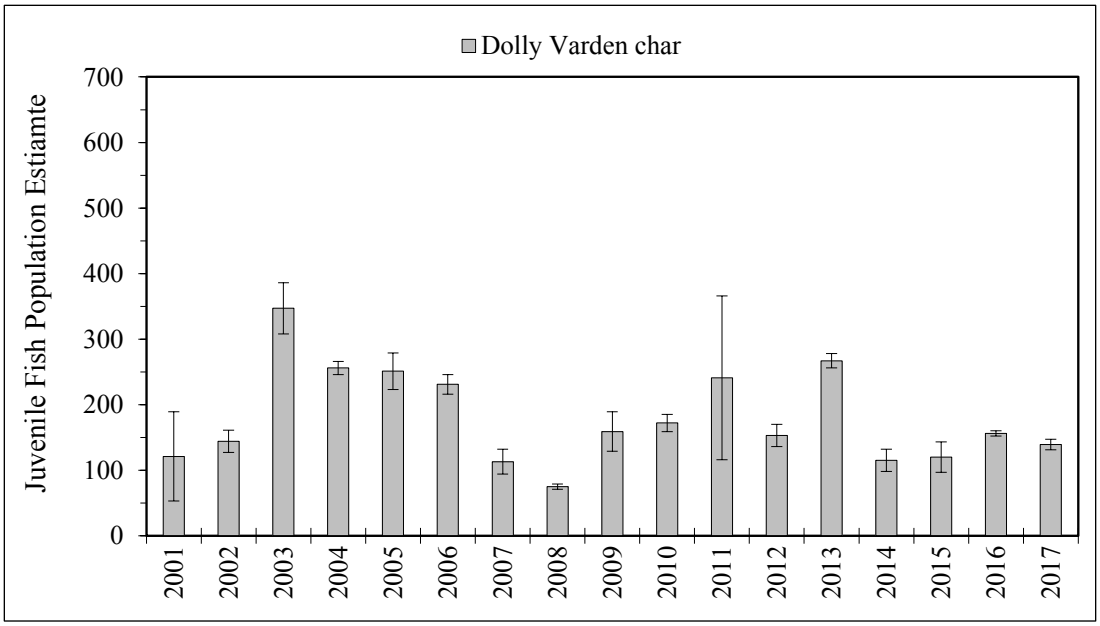

Figure 10.–Greens Creek Site 48 Dolly Varden population estimates.

Juvenile Fish Element Concentrations

Ag, Cd, Cu, Hg, Pb, Se, and Zn concentrations among the 2017 whole body Dolly Varden char samples were within the range of values observed since 2001 (Figure 11).

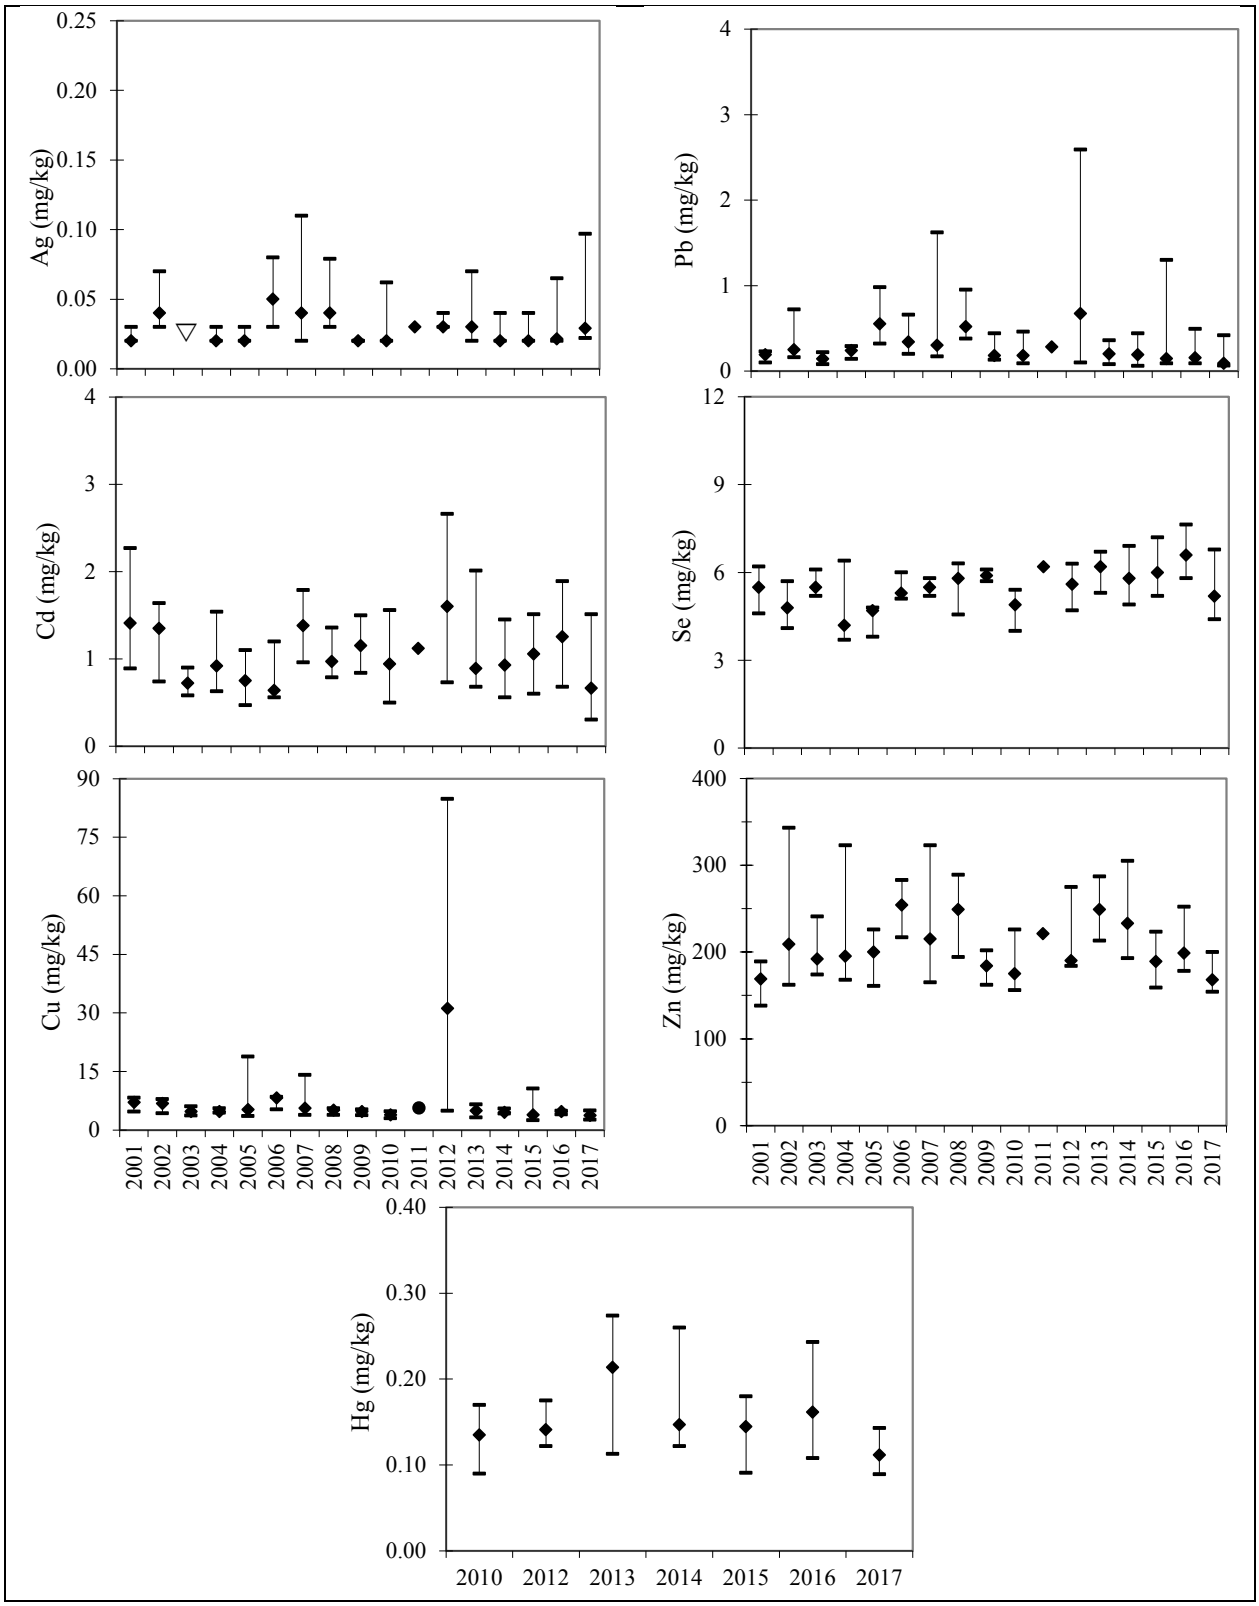

Figure 11.–Greens Creek Site 48 Dolly Varden char element concentrations.
Note: Minimum, median, and maximum whole body concentrations presented.

GREENS CREEK SITE 54

We sampled Greens Creek Site 54 on July 12, 2017. Hecla environmental staff measured basic water quality data at 0925: water temperature 7.1 ºC, conductivity 105.5 µS/cm, turbidity 2.22 NTU, and pH 7.87. We measured stream flow upstream of the crossing log and estimate discharge was 60.5 ft^3/s at 1515. The USGS gage measured 53.8 ft^3/s at 1500. Upstream of the fish sample reach, we observed more flow in the river-right channel and sand in the river-left channel limited benthic macroinvertebrate sampling sites.

Periphyton: Chlorophyll Density and Composition

The 2017 mean chlorophyll *a* density was 0.83 mg/m^2, the lowest mean density observed since 2001 (Figure 12).[bb] The samples contained about 85% chlorophyll *a*, 15% chlorophyll *c*, and no chlorophyll *b*, similar to mean composition in previous years.

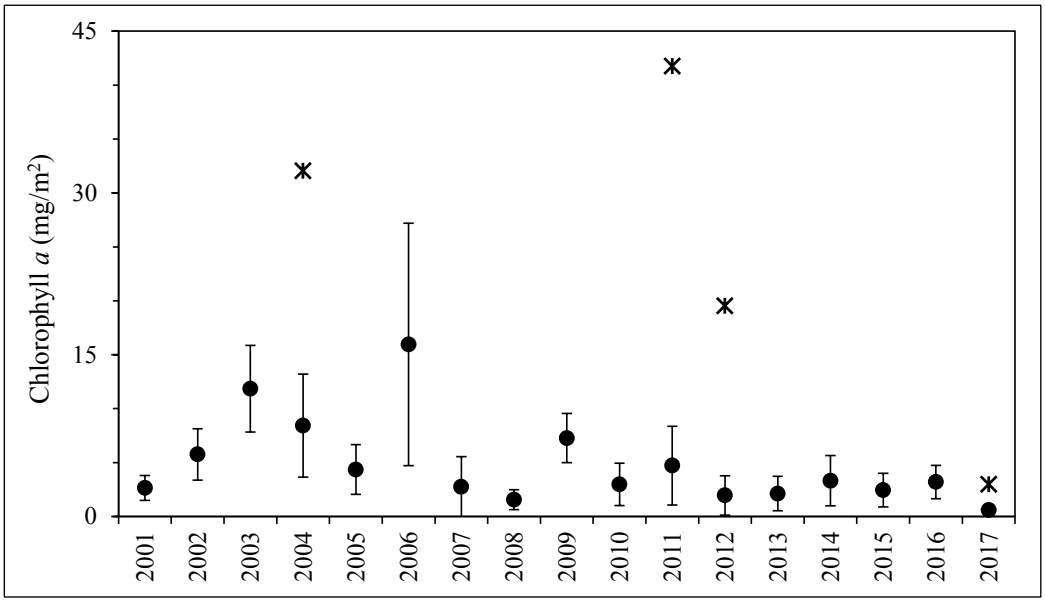

Figure 12.–Greens Creek Site 54 chlorophyll *a* densities.
Note: Mean density ± 1 SD, excluding potential outliers (∗).

Benthic Macroinvertebrate Density and Community Composition

Among the 2017 BMI samples, we counted 31 taxa and estimate mean density at 1,651 BMI/m^2, of which 89% were EPT insects, similar to previous years (Figures 13, 14). Dominant taxa were Ephemeroptera: *Epeorus* and *Baetis*, representing 23% and 22% of the samples.

[bb] We usually find significant differences in Site 54 chlorophyll *a* densities between the current year and the 2003 and 2006 data. Chlorophyll *a* densities in 2003 and 2006 were the greatest observed since 2001, which we attribute to natural variation.

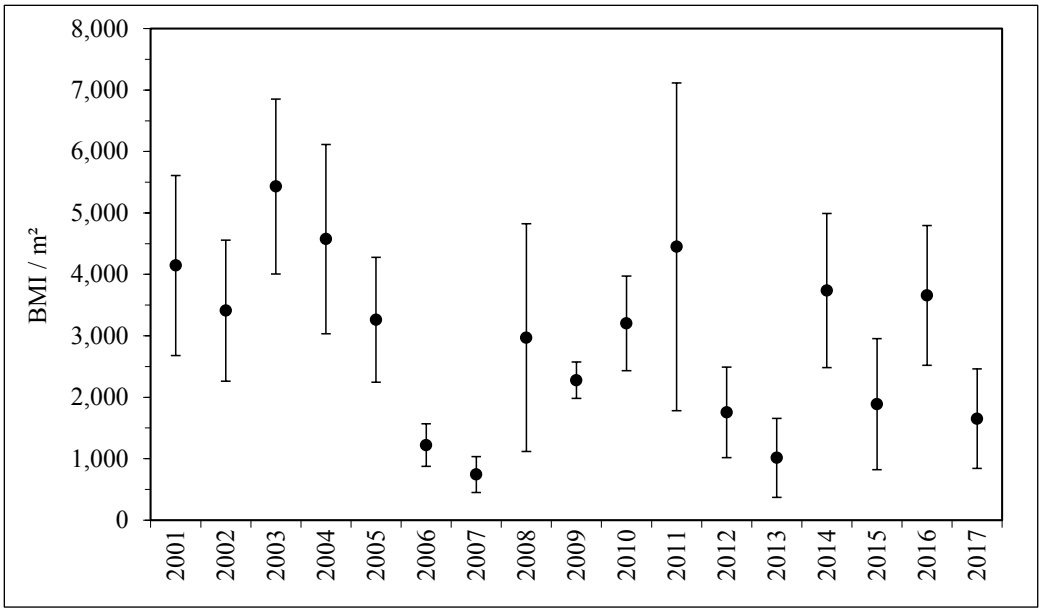

Figure 13.–Greens Creek Site 54 benthic macroinvertebrate densities.
Note: Mean density ± 1 SD.

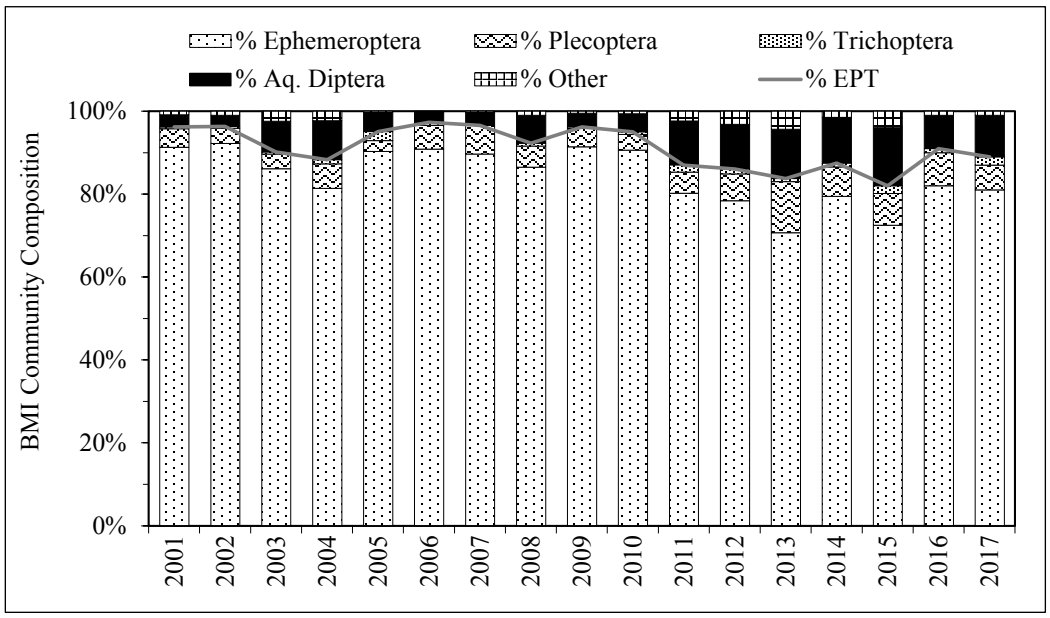

Figure 14.–Greens Creek Site 54 benthic macroinvertebrate community composition.

Juvenile Fish Populations and Fish Condition

We estimate the 2017 Dolly Varden char population at 358 ± 32 fish, within the range of previous estimates and greater than the previous three years (Figure 15). We did not capture coho salmon during the juvenile fish population study; however we observed young-of-year coho salmon and Dolly Varden char within the sample reach.

Mean fish condition among 306 Dolly Varden char we captured was 1.1, and the length frequency diagram suggests multiple age classes were present, as in previous years.

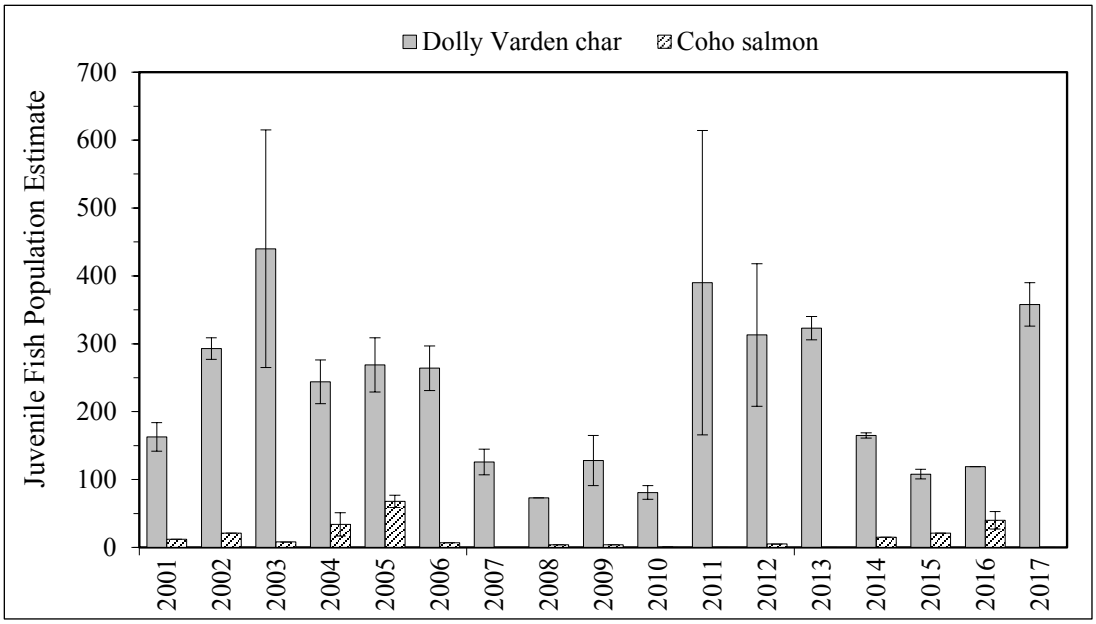

Figure 15.–Greens Creek Site 54 juvenile fish population estimates.
Note: 2001–2010 data from a 28 m reach, 2011–2017 data from a 50 m reach.

Juvenile Fish Element Concentrations

Ag, Cd, Cu, Hg, Pb, Se, and Zn concentrations among the 2017 whole body Dolly Varden char samples were within the range of values observed since 2001 (Figure 16).

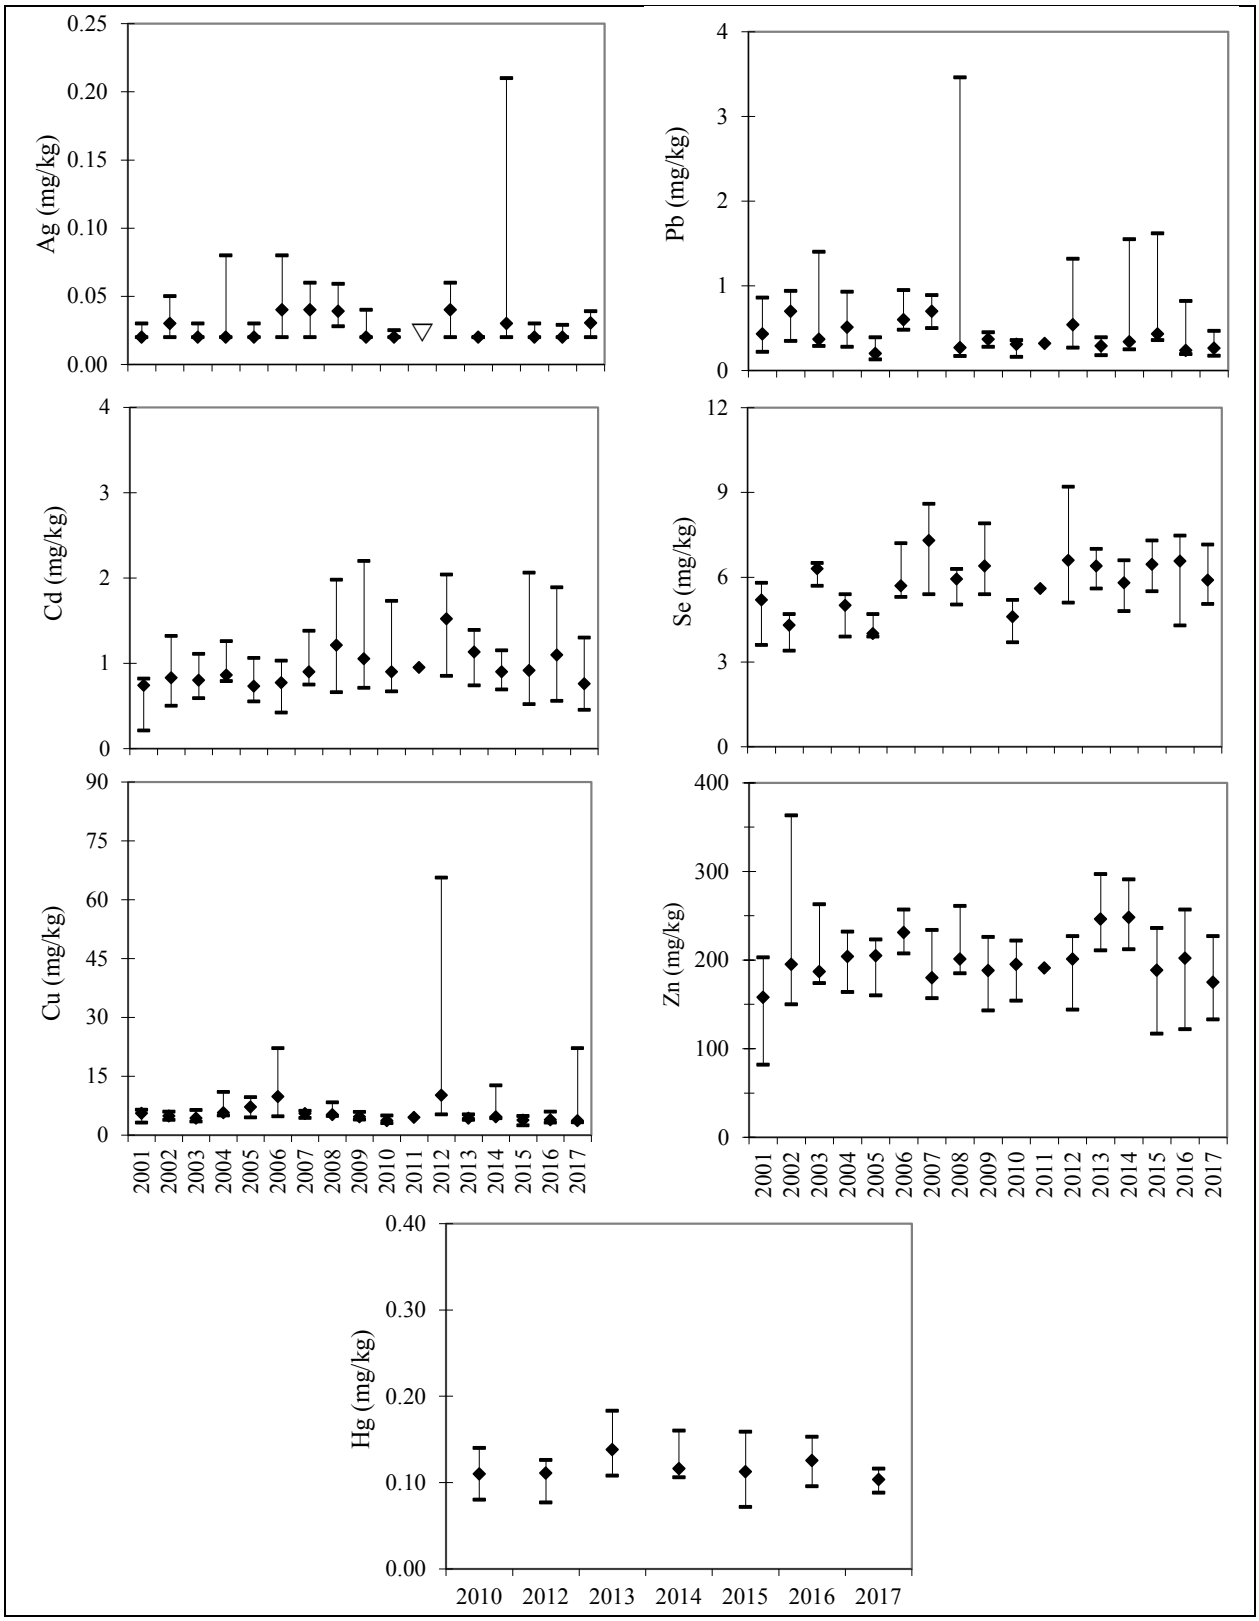

Figure 16.–Greens Creek Site 54 Dolly Varden char element concentrations.
Note: Minimum, median, and maximum whole body concentrations presented.

TRIBUTARY CREEK SITE 9

We sampled Tributary Creek Site 9 on July 11, 2017. GCM environmental staff measured basic water quality at 0830: water temperature 10.6 ºC, conductivity 77.85 µS/cm, turbidity 5.01 NTU, and pH 6.78. Water level was too low to measure stream flow. This year, the lower portion of the sample reach had more flow on river-left and the beaver dam upstream of the sample reach was larger.

Periphyton: Chlorophyll Density and Composition

The 2017 mean chlorophyll *a* density was 4.09 mg/m^2, within the range observed since 2001 (Figure 17). The samples contained about 93% chlorophyll *a*, 7% chlorophyll *c*, and no chlorophyll *b*, similar to mean composition in previous years.

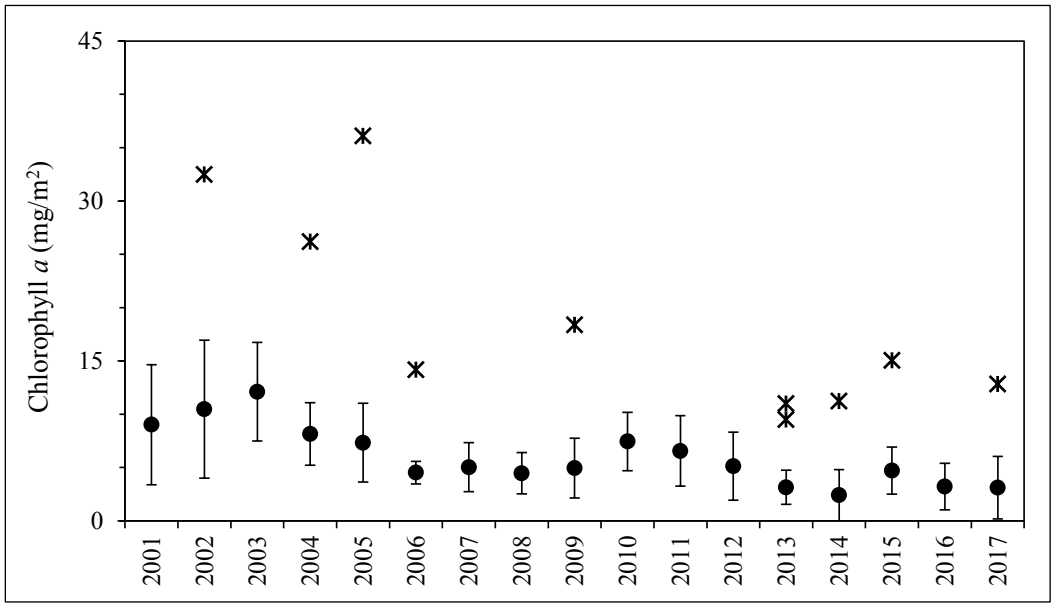

Figure 17.–Tributary Creek Site 9 chlorophyll *a* densities.
Note: Mean density ± 1 SD, excluding potential outliers (∗).

Benthic Macroinvertebrate Density and Community Composition

Among the 2017 BMI samples, we counted 29 taxa and estimate mean density at 2,625 BMI/m^2, similar to previous years (Figure 18). EPT insects accounted for 46% of the samples, greater than the lowest percentage observed in 2016 (Figure 19). Dominant taxa were Diptera: Chironomidae and Plecoptera*: Suwallia*, representing 24% and 15% of the samples.

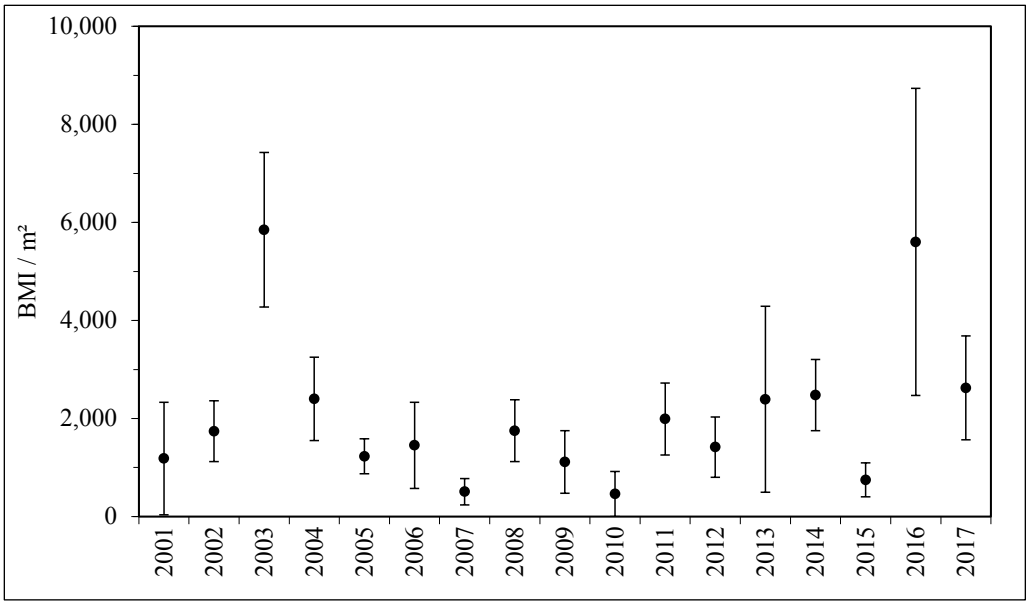

Figure 18.–Tributary Creek Site 9 benthic macroinvertebrate densities.
Note: Mean density ± 1 SD.

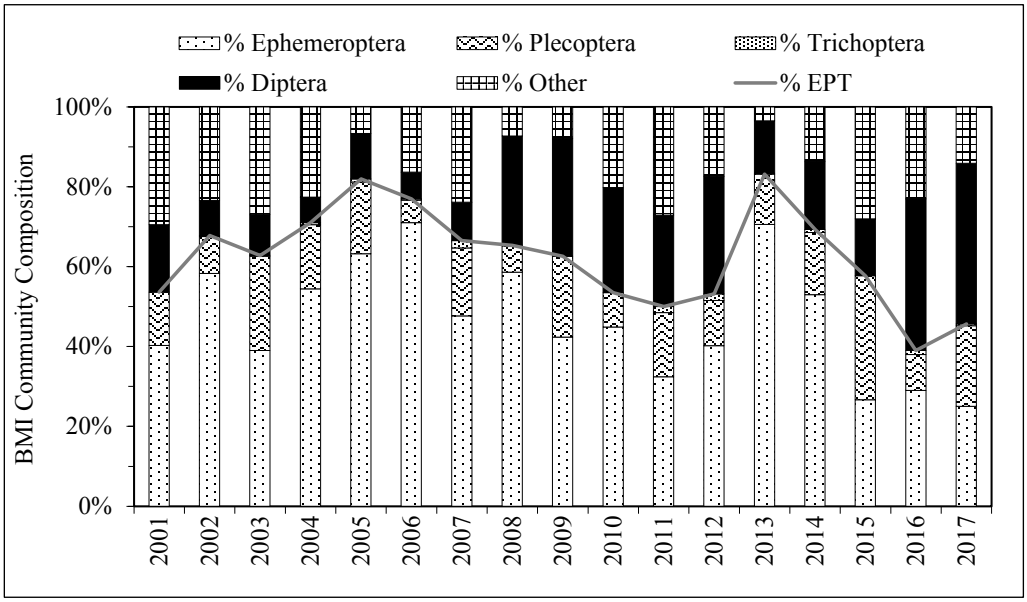

Figure 19.–Tributary Creek Site 9 benthic macroinvertebrate community composition.

Juvenile Fish Populations and Fish Condition

We estimate the 2017 Dolly Varden char population at 72 ± 20 fish, greater than most previous years (Figure 20). Mean condition for the 56 Dolly Varden char we captured was 1.1 and the length frequency diagram suggests multiple age classes were present, as in previous years.

We estimate the 2017 coho salmon population at 101 ± 6 fish, within the range observed since 2001 (Figure 20). Mean condition for the 96 coho salmon we captured was 1.3 and the length frequency diagram suggests two age classes were present, as in previous years.

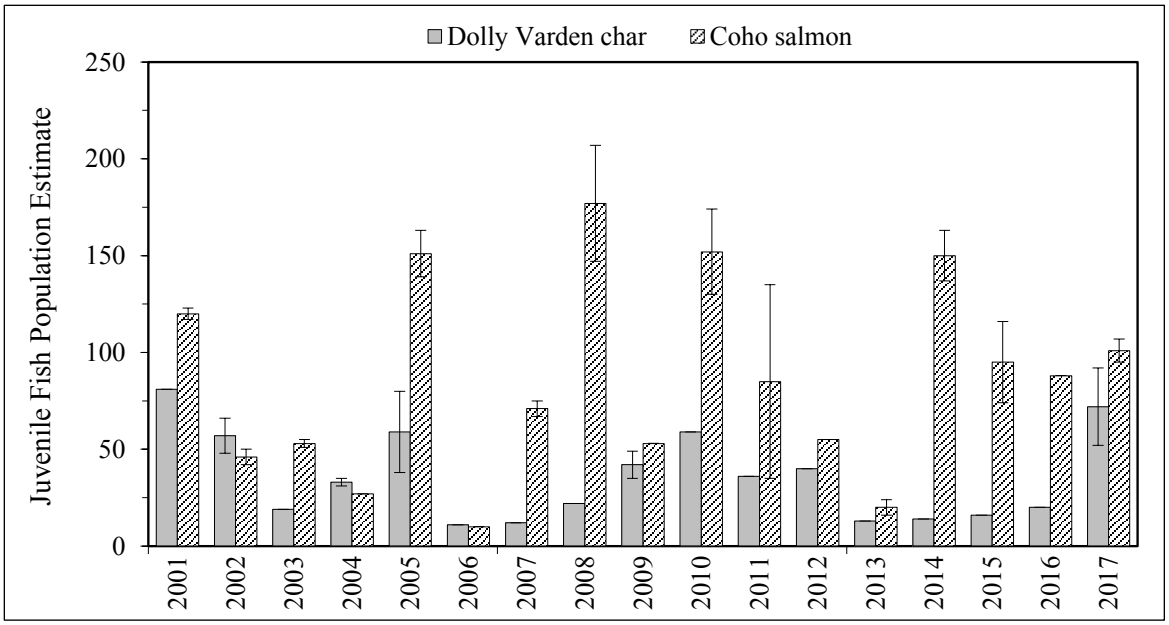

Figure 20.–Tributary Creek Site 9 juvenile fish population estimates.

Juvenile Fish Element Concentrations

Ag, Cd, Cu, Pb, Se, and Zn concentrations among the 2017 whole body Dolly Varden char samples were within the range of values observed since 2001, and we observed the largest range of Hg concentrations since sampling began in 2010 (Figure 21).

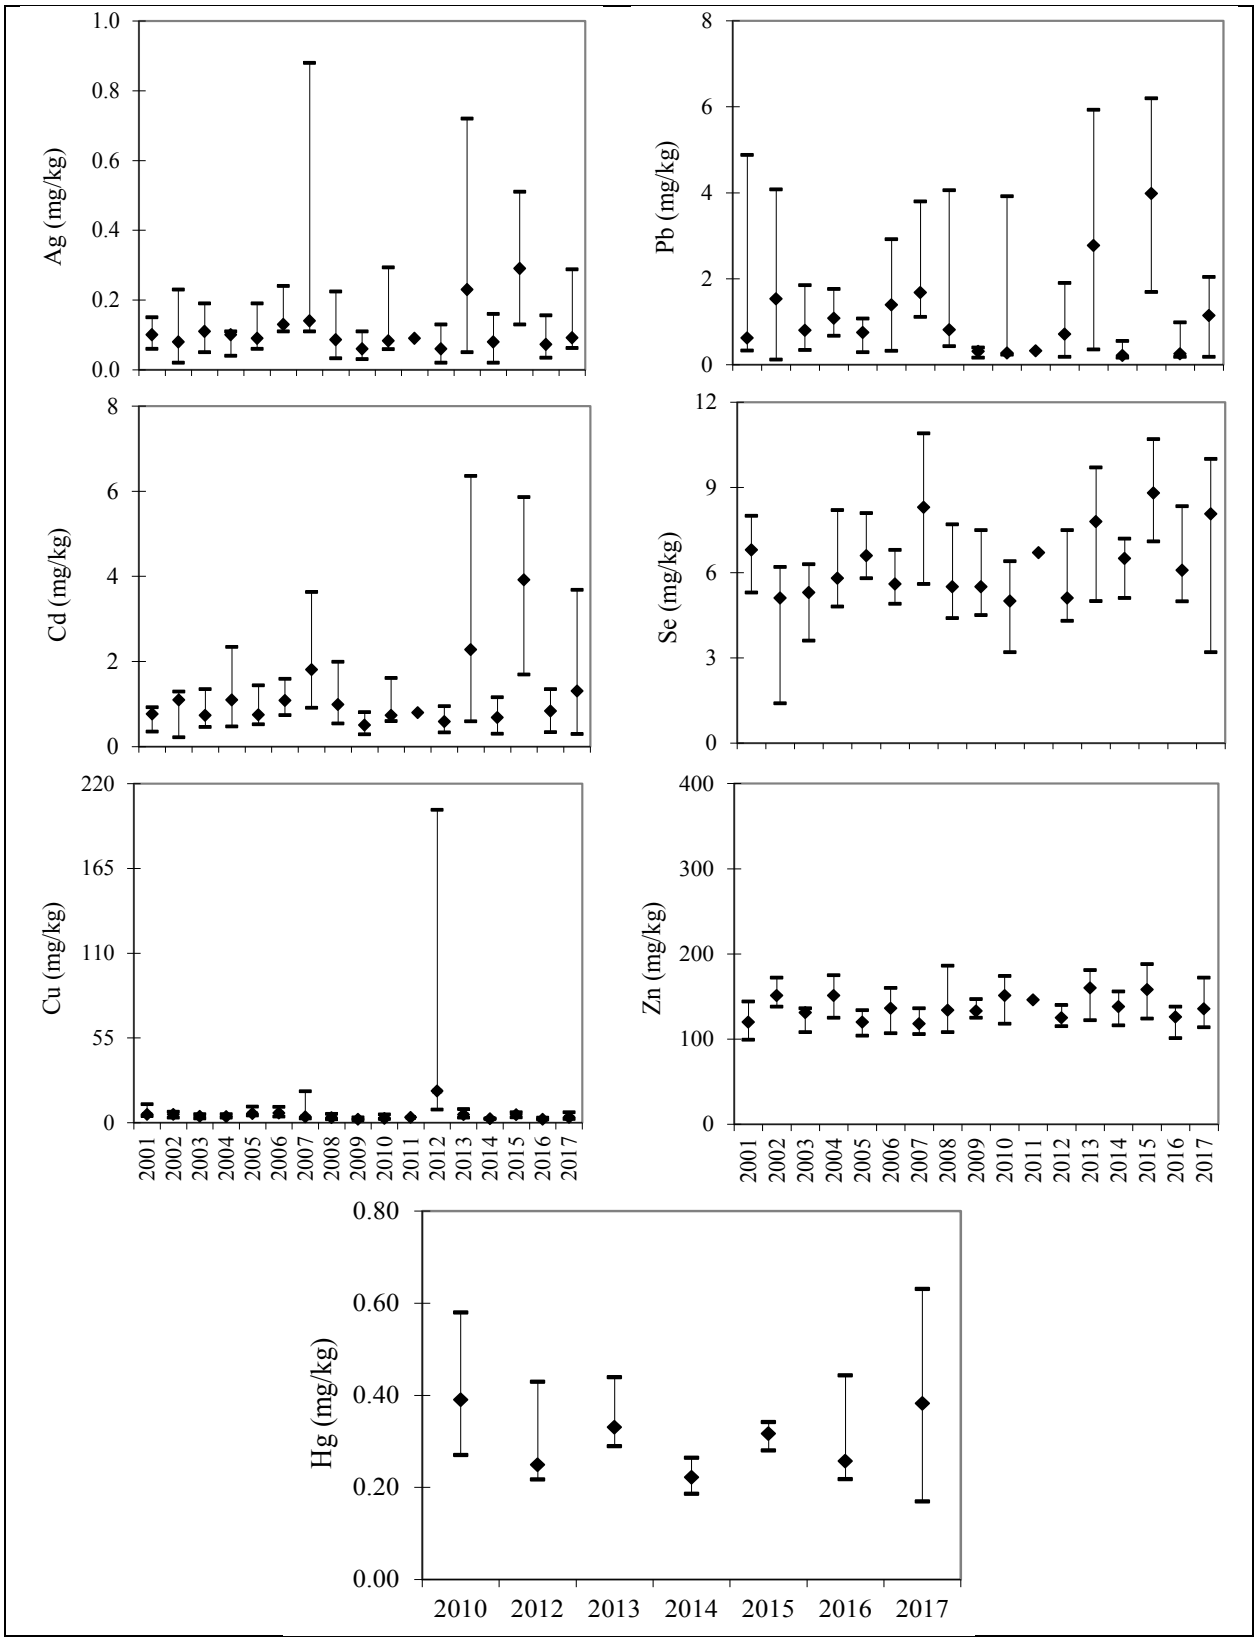

Figure 21.–Tributary Creek Site 9 Dolly Varden char element concentrations.
Note: Minimum, median, and maximum whole body concentrations presented.

COMPARISONS AMONG GREENS CREEK SITES

Periphyton: Chlorophyll Density and Composition

Chlorophyll *a* densities among the 2017 samples from Site 48 and Site 54 were not significantly different. Mean chlorophyll *a* densities at Site 48 and Site 54 generally followed a similar trend 2001–2017 (Figure 22), with peak densities observed in 2003, 2004, and 2006. Greens Creek discharges were low prior to sampling in 2003 and 2004 and may have contributed to greater chlorophyll *a* densities those years, while greater discharges prior to sampling in 2007, 2008, 2012, and 2017 may explain lower mean chlorophyll *a* densities observed those years.

Periphyton samples collected at Site 48 and Site 54 generally contained about 90% chlorophyll *a,* zero or nearly zero chlorophyll *b,* and about 10% chlorophyll *c* each year.

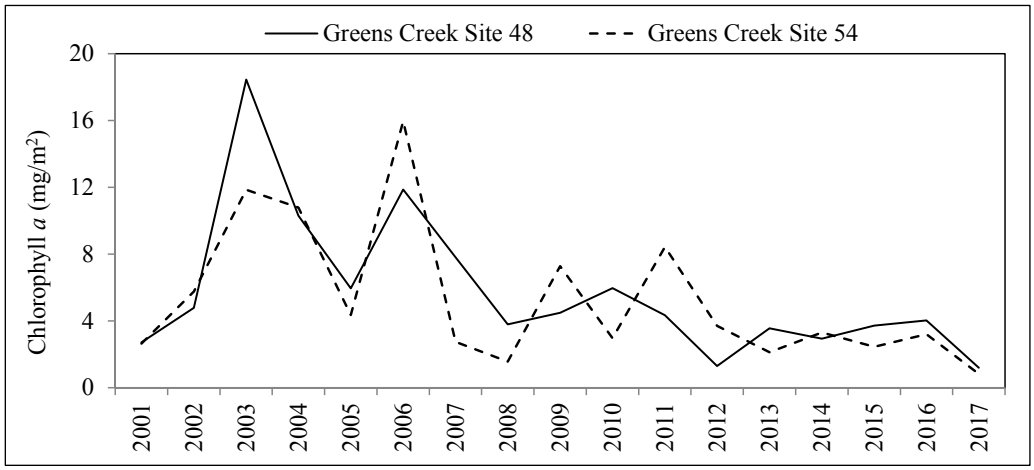

Figure 22.–Greens Creek mean chlorophyll *a* densities.

Benthic Macroinvertebrate Density and Community Composition

Mean benthic macroinvertebrate density and taxonomic richness among Site 48 and Site 54 samples generally followed similar trends 2001–2017 (Figures 23, 24), and EPT insects usually comprised more than 80% of the organisms among samples at each site, each year.

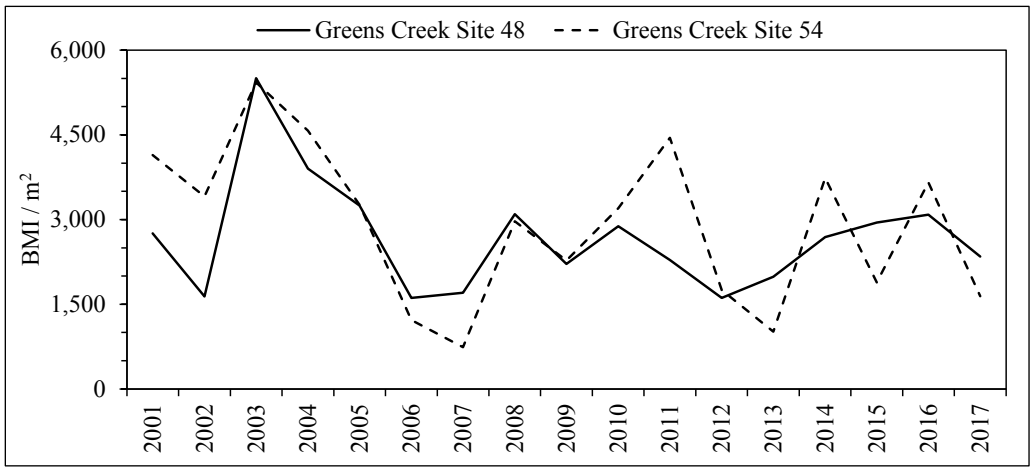

Figure 23.–Greens Creek mean benthic macroinvertebrate densities.

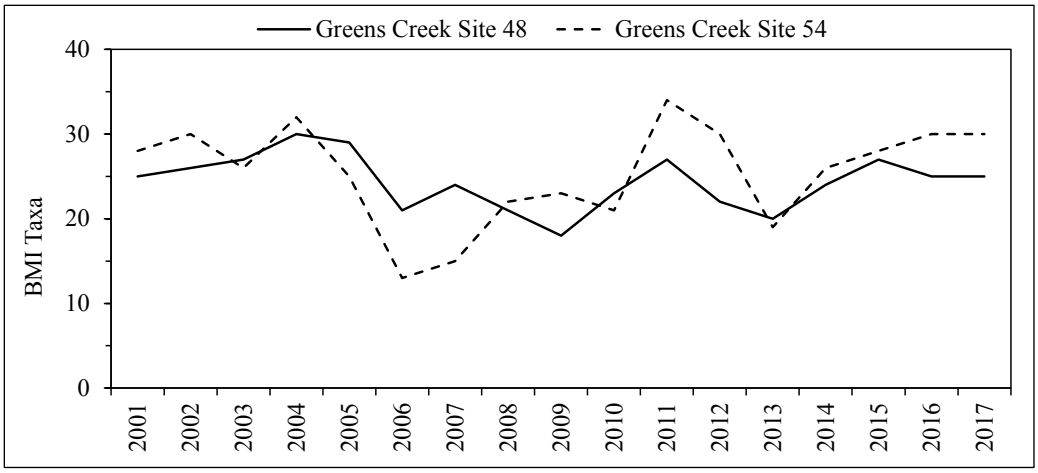

Figure 24.–Greens Creek benthic macroinvertebrate taxa richness.

Juvenile Fish Populations and Fish Condition

The 2017 Site 54 Dolly Varden char population estimate was significantly greater than the Site 48 population estimate. Population estimates among sites generally followed a similar trend from 2001 to 2016 (Figure 25). We captured several age classes of Dolly Varden char at both sites most years, and mean fish condition was similar among sites each year, about 1.0.

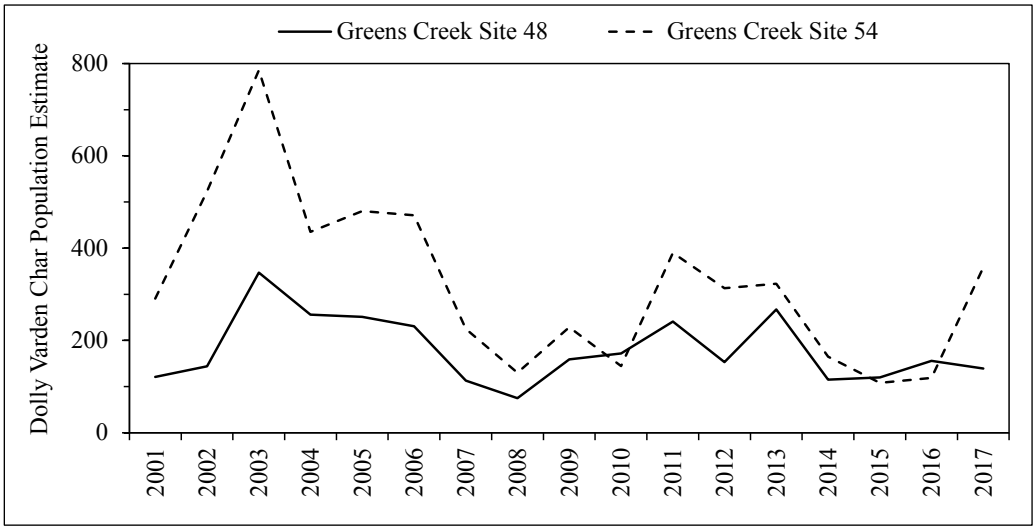

Figure 25.–Greens Creek Dolly Varden char population estimates.
Note: Site 54 2001–2010 data extrapolated to 50 m sample reach for comparison.

Juvenile Fish Element Concentrations

Comparing the 2017 Greens Creek Dolly Varden char whole body element concentrations data, the mean ranks for Pb concentration were significantly different.

COMPARISONS AMONG SITES

Juvenile Fish Element Concentrations

Comparing the 2017 Greens Creek and Tributary Creek Dolly Varden char element concentrations data (Figure 26):

- The Site 9 mean ranks for Ag, Hg, Pb, and Zn concentrations were significantly different than the mean ranks for Site 48 and Site 54; and
- The Site 9 mean ranks for Cd and Se concentrations were significantly different than the mean ranks for Site 48.

The 2017 results were within the range of values reported for reference and exploration sites elsewhere in Alaska (Legere and Timothy 2016).

Site 9 whole body Dolly Varden char samples contained greater concentrations and variability than the Site 48 and Site 54 samples, except Cu and Zn which were generally greater at Site 48 (Figure 27).

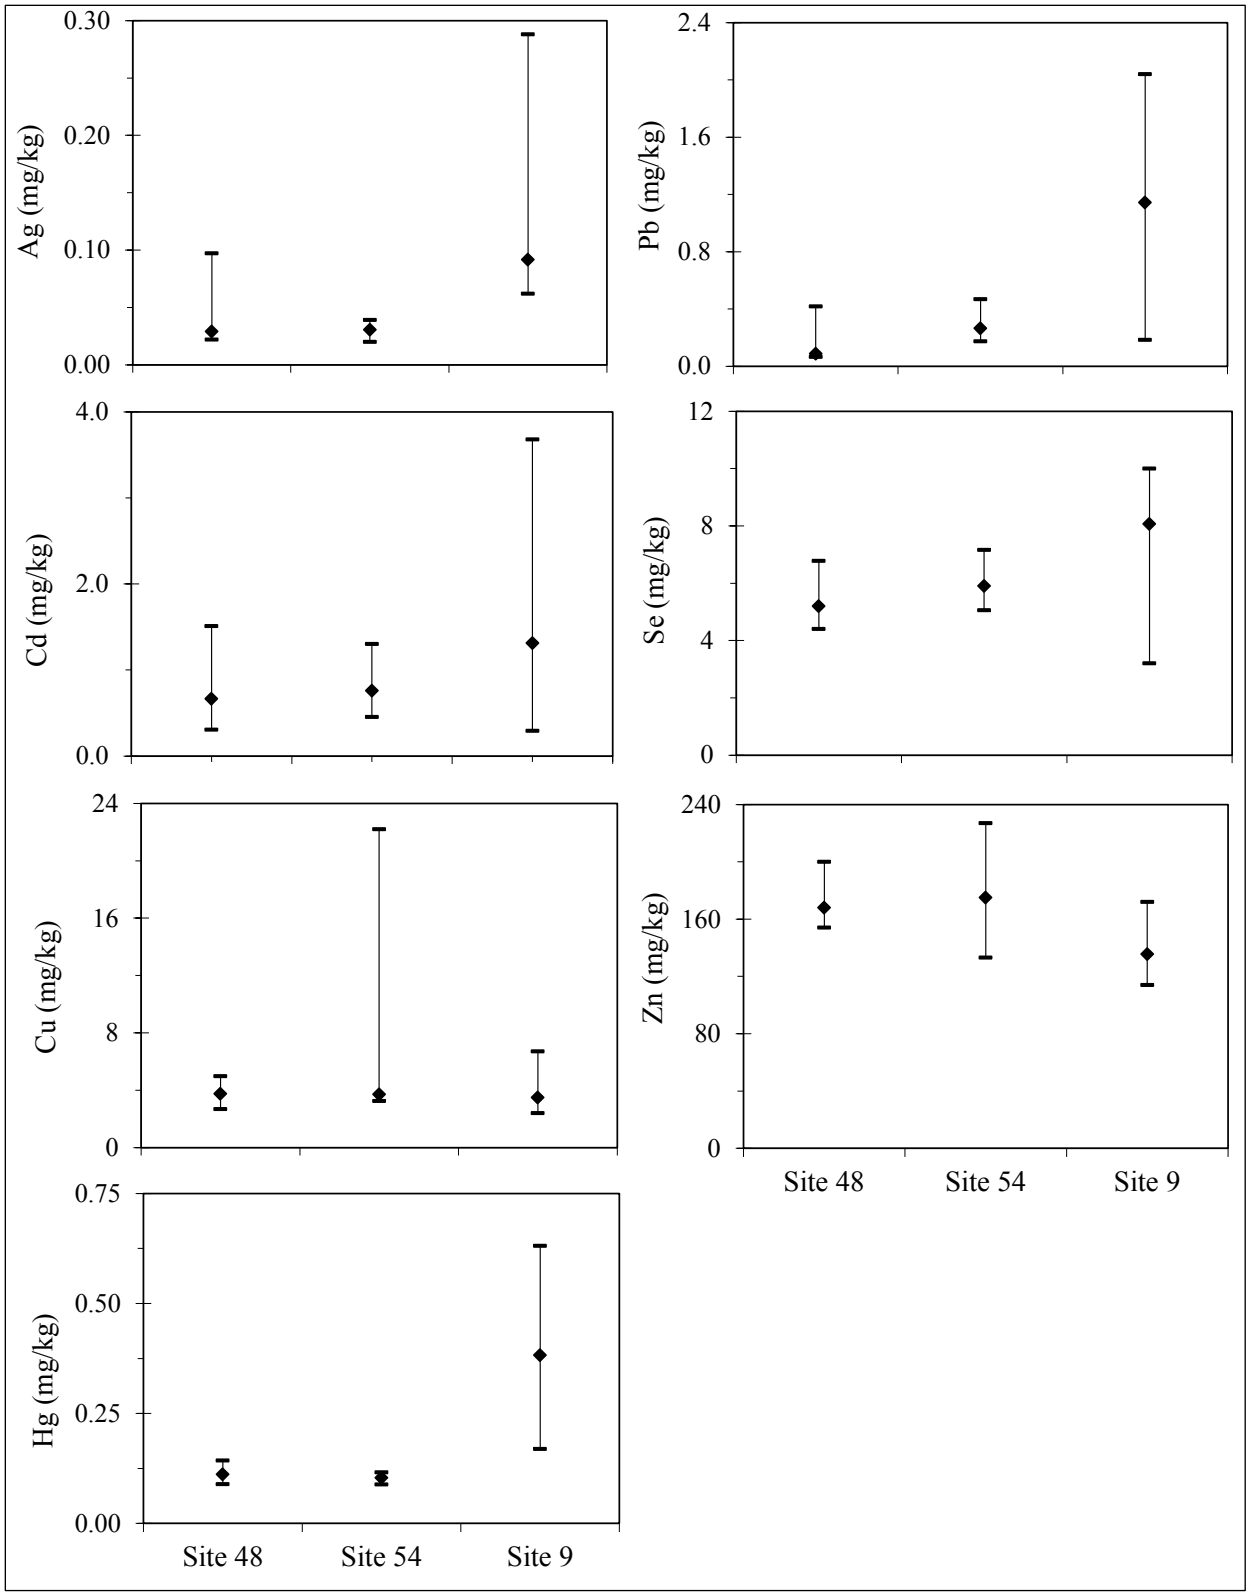

Figure 26.–2017 Greens Creek and Tributary Creek Dolly Varden char element concentrations.
Note: Minimum, median, and maximum whole body concentrations presented.

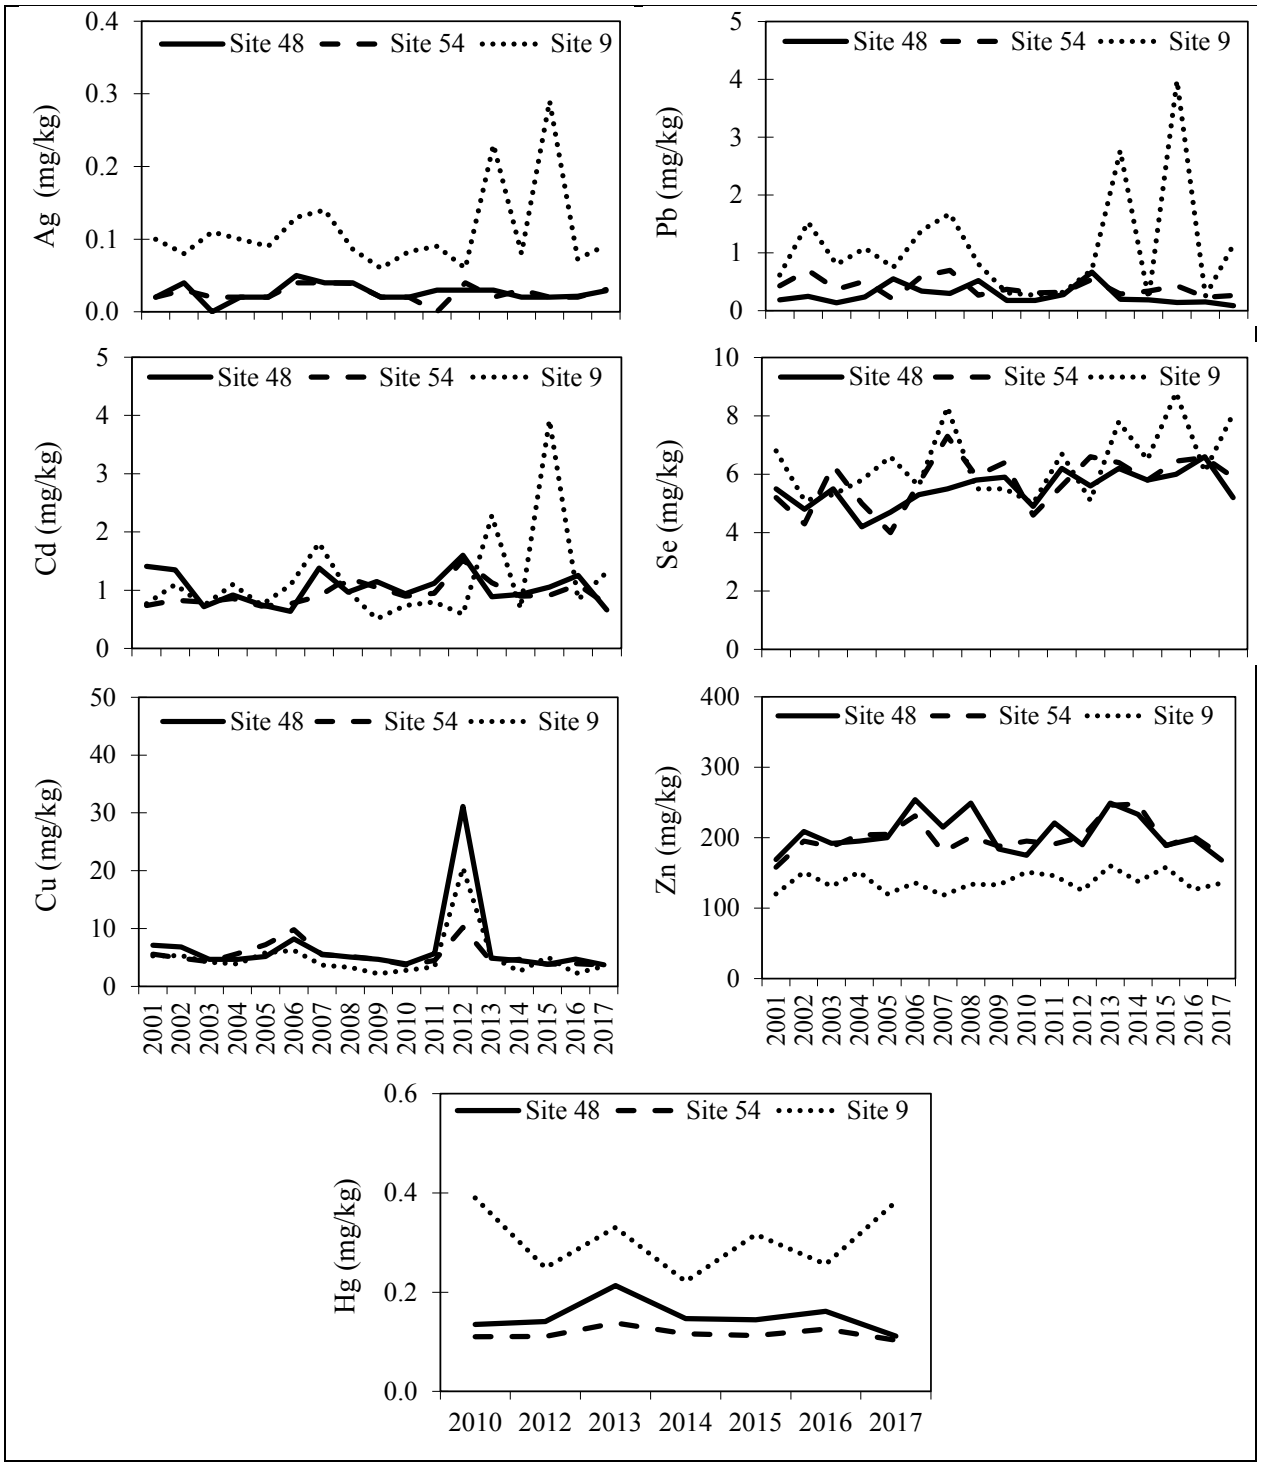

Figure 27.–Greens Creek and Tributary Creek Dolly Varden char median element concentrations.

RE: 2017 Greens Creek Mine Biomonitoring / 160004158

Dear Kate,

Enclosed are the results of the sample(s) submitted to our laboratory July 27, 2017
For your reference, these analyses have been assigned our service request number **K1707898.**

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3293. You may also contact me via email at Shar.Samy@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Shar Samy, Ph.D.

Table of Contents

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated value.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.
H	The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

#	The control limit criteria is not applicable. See case narrative.
J	The result is an estimated value.
E	The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
M	The duplicate injection precision was not met.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
S	The reported value was determined by the Method of Standard Additions (MSA).
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
W	The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
+	The correlation coefficient for the MSA is less than 0.995.
Q	See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
A	A tentatively identified compound, a suspected aldol-condensation product.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
C	The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
D	The reported result is from a dilution.
E	The result is an estimated value.
J	The result is an estimated value.
N	The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

F	The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
L	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
H	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
O	The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
Y	The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
Z	The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.
Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/anlayte is offered by that state.

ALS ENVIRONMENTAL

Client:	Alaska Department of Fish and Game	**Service Request No.:**	K1707898
Project:	2017 Greens Creek Mine Biomonitoring/ 160004158	**Date Received:**	07/27/17
Sample Matrix:	Animal Tissue		

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier II data deliverables. When appropriate to the method, method blank results have been reported with each analytical test. Additional quality control analyses reported herein include: Laboratory Duplicate (DUP), Matrix Spike (MS), and Matrix/Duplicate Matrix Spike (MS/DMS).

Sample Receipt

Thirty animal tissue samples were received for analysis at ALS Environmental on 07/27/17. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored frozen at –20ºC upon receipt at the laboratory.

Total Metals

Relative Percent Difference Exceptions:
The Relative Percent Difference (RPD) for the replicate analysis of Lead in sample 2017TC9DV1 was outside the normal ALS control limits. The samples were homogenized, freeze dried, then ground prior to digestion, however this was not sufficient to achieve a completely uniform distribution of Lead in the tissue.

No other anomalies associated with the analysis of these samples were observed.

QA/QC Report

Client:	Alaska Department of Fish and Game	**Service Request:**	K1707898
Project	2017 Greens Creek Mine Biomonitoring/160004158	**Date Collected:**	NA
Sample Matrix:	Animal Tissue	**Date Received:**	NA
		Date Analyzed:	08/08/17

Replicate Sample Summary
Inorganic Parameters

Sample Name:	Batch QC	**Units:**	Percent
Lab Code:	K1707899-006	**Basis:**	Wet

Analyte Name	Analysis Method	MRL	Sample Result	Duplicate Sample K1707899-006DUP Result	Average	RPD	RPD Limit
Total Solids	Freeze Dry	-	24.6	24.9	24.8	1	20

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

QA/QC Report

Client:	Alaska Department of Fish and Game	**Service Request:**	K1707898
Project:	2017 Greens Creek Mine/Biomonitoring/160004158	**Date Collected:**	NA
LCS Matrix:	Tissue	**Date Received:**	NA
		Date Extracted:	08/22/17
		Date Analyzed:	08/24/17

Standard Reference Material Summary
Total Metals

Sample Name:	Standard Reference Material	Units:	mg/Kg (ppm)
Lab Code:	KQ1711797-04SRM4	Basis:	Dry
Test Notes:	Tort-3 Solids = 99.1%		

Source: N.R.C.C. Tort-3

Analyte	Prep Method	Analysis Method	True Value	Result	Percent Recovery	Control Limits	Result Notes
Cadmium	PSEP Tissue	6020A	42.3	42.3	100	32.4-52.9	
Copper	PSEP Tissue	6020A	497	432	87	380-623
