Table B-1. Acid Base Accounting Results

Notes (MESH Programs):

AGP = Acid generating potential in tonnes CaCO₃ equivalent per 1000 tonnes of material. AP is determined from calculated sulphide sulphur content: S(T) - S(SO₄).

ANP = Acid neutralization potential in tonnes CaCO₃ equivalent per 1000 tonnes of material.

NNP = Net neutralization potential; NP - AP

Carbonate NP is calculated from TIC originating from carbonates and is expressed in kg CaCO₃/tonne.

Notes (KP Program):

Acid Neutralization Potential (ANP) was reported by the lab as Neutralization Potential. Analytical Method: Sobek (EPA-600) through addition of acid, heating and titration.

Acid Generating Potential (AGP) was reported by the lab as Maximum Potential Acidity. Value determined by calculating Total Sulphur (%S) * 31.25.

Sulphate Sulphur Analytical Method: Sobek (EPA-600) through acid leaching processing and gravimetric analysis.

Sulphide Sulphur Analytical Method: Sobek (EPA-600) through bromine and nitric acid digestion, followed by gravimetric analysis.

Total Sulphur Analytical Method: Sobek (EPA-600) through heating in a Leco induction furnace and measuring the SO₂ released with an Infra-red detector.

Inorganic Carbon Analytical Method: Carbon assay through heating sample in a Leco induction furnace followed by a gasometric measurement of CO

Carbonate Neutralization Potential (CNP) was calculated as follows: $\text{CO}_2\% * (100/44) * 10$

General Notes (all programs):

General Notes (all programs):

The detection limit has been used for plotting samples below the detection limit (<0.01 to 0.01 for S % and ADR Classification based on Schek ANR:ACR) and if no Schek ANR then based on Carbonate ANR:ACR.

ARD Classification based on Sobek ANP:AGP, and if no Sobek ANP then based on Carbonate ANP:AGP
RAC = essentially acid generating - Sobek ANP:AGP > 2

PAG = potentially acid generating = Sobek ANP:AGP <3
 non-PAG = non-potentially acid generating = Sobek ANP:AGP > 3

non-PAG = non potentially acid generating = Sobek ANP:AGP >3

NOTES:										
highlighted cells = samples collected for off-site QAQC analysis										
footage in red is based on a survey face (asbuilts from Redpath)--other intervals are corrected to this measurement										
rocktype column is grouped by grout ring										
probehole and blast round footage has been corrected from 813 ft to present by L. Cornejo (May 2008)										
On site XRF instrument is calibrated for very low sulphur values. Sulphur analysis for samples with > 1% sulphur are unreliable and commonly yield negative values.										
All samples yielding negative sulphur values or values of > 1% will be re-analyzed by Leco furnace at an off-site laboratory.										
* Round footage in italics not finalized until next ring face @ approx. 2156 is surveyed
