Symbols and Abbreviations

The following symbols and abbreviations, and others approved for the Système International d'Unités (SI), are used without definition in reports by Habitat Section and the Divisions of Sport Fish and Commercial Fisheries. All others, including deviations from definitions listed below, are noted in the text at first mention, as well as in the titles or footnotes of tables, and in figures or figure captions.

Weights and measures (metric)		General		Measures (fisheries)	
centimeter	cm	Alaska Administrative Code	AAC	fork length	FL
deciliter	dL	all commonly accepted abbreviations	e.g., Mr., Mrs., AM, PM, etc.	mid-eye-to-fork	MEF
gram	g	all commonly accepted professional titles	e.g., Dr., Ph.D., R.N., etc.	mid-eye-to-tail fork	METF
hectare	ha	at	@	standard length	SL
kilogram	kg	compass directions:		total length	TL
kilometer	km	east	E		
liter	L	north	N	Mathematics, statistics	
meter	m	south	S	<i>all standard mathematical signs, symbols and abbreviations</i>	
milliliter	mL	west	W	alternate hypothesis	H _A
millimeter	mm	copyright	©	base of natural logarithm	e
nanometer	nm	corporate suffixes:		catch per unit effort	CPUE
		Company	Co.	coefficient of variation	CV
Weights and measures (English)		Corporation	Corp.	common test statistics	(F, t, χ^2 , etc.)
cubic feet per second	ft ³ /s	Incorporated	Inc.	confidence interval	CI
foot	ft	Limited	Ltd.	correlation coefficient	
gallon	gal	District of Columbia	D.C.	(multiple)	R
inch	in	et alii (and others)	et al.	correlation coefficient	
mile	mi	et cetera (and so forth)	etc.	(simple)	r
nautical mile	nmi	exempli gratia		covariance	cov

ACKNOWLEDGEMENTS

Constantine North, Inc. provided financial support for this project. Camp Manager Darsie Culbeck provided logistical support and Environmental Manager Allegra Cairns provided Glacier Creek water quality and discharge data and reviewed the draft report.

Alaska Department of Fish and Game Habitat Section Southeast Regional Supervisor Kate Kanouse collaborated on study design. Habitat Biologist William Kane assisted with sampling and processed periphyton samples. Habitat Biologist Greg Albrecht identified benthic macroinvertebrates. Habitat Biologist Kelsey Dean and Fish and Wildlife Technician Ben Landes assisted with processing the benthic macroinvertebrate samples, and Habitat Biologist Evan Fritz verified data entry. Habitat Section Operations Manager Dr. Al Ott, Kate Kanouse, and William Kane reviewed and edited the report. Thank you all for your contribution.

EXECUTIVE SUMMARY

Constantine North, Inc. (CNI) began exploratory drilling at the Palmer Exploration Project in 2006 and has identified barite, copper, gold, silver, and zinc deposits within the volcanogenic massive sulfide deposit that may support a hard rock mine. CNI contracted with the Alaska Department of Fish and Game (ADF&G) Habitat Section to study aquatic resources in Glacier Creek, a glacial water body draining the area. With CNI, Habitat Section biologists developed a plan to study periphyton, benthic macroinvertebrates, fish, and sediment at two sites in Glacier Creek, and sampled the sites in spring 2016–2021 documenting baseline aquatic productivity and sediment conditions.

We sampled the lower and middle reaches of Glacier Creek on June 15 and 16, 2021, 1–2 weeks later than previous years due to late snow melt. Mean chlorophyll *a* density was 0.77 mg/m² at Lower Glacier Creek, within the range observed since 2016, and 2.03 mg/m² at Middle Glacier Creek, the greatest observed. The 2021 mean benthic macroinvertebrate density at each site was within the ranges observed since 2016, and similar to the 2019 sample results. The macroinvertebrate communities were again dominated by Diptera: Chironomidae insects; generally, Chironomidae insects are fast colonizers, easily adapt to changing habitats, and can exercise more than one feeding strategy (Entrekin et al. 2007).

We captured 10 Dolly Varden char *Salvelinus malma* in Lower Glacier Creek and 5 Dolly Varden char in Middle Glacier Creek; these samples were analyzed for whole body concentrations of arsenic, cadmium, copper, lead, mercury, silver, selenium, and zinc. All fish were in good condition, and we captured one 260 mm adult cutthroat trout *Oncorhynchus clarkii* in Lower Glacier Creek for the first time during biomonitoring. Most median Dolly Varden char element concentrations were greater among the Lower Glacier Creek samples, while arsenic and silver concentrations were often not detected at both sites. Most concentrations were within the ranges observed in whole body Dolly Varden char samples collected from reference and exploration sites elsewhere in Alaska (Legere and Timothy 2016).

We sampled fine sediment at each site for aluminum, arsenic, cadmium, copper, iron, lead, mercury, selenium, silver, and zinc and found median element concentrations generally similar among sites. The baseline cadmium, copper, and zinc concentrations were near or above the freshwater sediment guidelines suggested by Buchman (2008); while we find the sediment guidelines useful for evaluating the data, we also recognize organisms can respond differently in nature.

INTRODUCTION

The Palmer Exploration Project is located in the Porcupine Mining District about 55 km north of Haines by air in the southeastern extent of the Saint Elias Mountains near the U.S./Canada border (Figure 1). At the site, placer gold mining in Glacier Creek and its tributaries occurred during the 20th century; in 1969, local prospector Merrill Palmer discovered base-metal sulfides and barite that initiated exploration drill programs by several different companies in the following years, including CNI beginning in 2006 (CNI 2015).

The Palmer Prospect consists of two primary deposits: the Palmer Deposit on the south wall of the mountainside on the west side of the valley and the AG Deposit at the head of the valley under the Saksai Glacier. The project is located on the same volcanogenic massive sulfide belt as Greens Creek Mine on Admiralty Island, about 100 air miles south. CNI has identified barite, copper,

gold, silver, and zinc as potential mineable resources (CNI 2015). From 2014–2018, CNI constructed a 6.73 km single lane gravel road to support mineral exploration on the mountainside in the Glacier Creek valley. In 2021, CNI continued exploration activities.

Figure 1.–Palmer Exploration Project area map.

Tetra Tech (2013) and ADF&G biologists have documented^a Dolly Varden char in Glacier Creek and three tributaries. Since 2016, CNI contracted with the ADF&G Habitat Section to conduct baseline studies in Glacier Creek. Following review of CNI’s water quality sample data, Habitat biologists developed a study plan to investigate and document aquatic resources in Glacier Creek, similar to aquatic sampling programs at the Greens Creek Mine (Kane 2021) and Kensington Gold Mine (Timothy and Kanouse 2014), underground hard rock mines in Southeast Alaska. The study plan includes sampling periphyton, benthic macroinvertebrates, and fish—aquatic resources influenced by water and sediment quality through natural processes—to provide baseline information on aquatic productivity in Glacier Creek. We conducted these studies in spring 2016–2021; sampling results from previous years are presented in Kanouse and Legere (2016), Legere and Kanouse (2017–2018), and Krull (2019–2020).

PURPOSE

The purpose of this investigation and technical report is to document the baseline condition, abundance, and composition of biological communities and sediments in Glacier Creek.

AQUATIC STUDIES

We completed the following studies at two sample sites in Glacier Creek:

- Chlorophyll density and composition;
- Benthic macroinvertebrate density and community composition;
- Dolly Varden char condition and whole body element concentrations; and
- Sediment composition and element concentrations.

STUDY AREA

Glacier Creek is about 7 km long, drains a 39 km² watershed between its headwaters at the Saksaiia Glacier and confluence with the Klehini River, and contributes about 5% of the total Klehini River drainage area measured from the former U.S. Geological Survey gage at the Klehini River bridge—about 20 km downstream of the prospect.^b

Continuous discharge data do not exist for Glacier Creek. Based on the relative size of the Glacier Creek and Klehini River drainage areas, Integral Consulting, Inc.^c estimated mean Glacier Creek discharge between May and September at 150 ft³/s. Field staff measured discharge opportunistically from 2015–2018 between June and September ranging 57–272 ft³/s, with the lowest discharge measured during September. During winter, spring, and fall of 2019 and 2020, CNI staff measured discharge about 2 km upstream of the Middle Glacier Creek sampling site

Pender St. Ste. 320, Vancouver, BC, Canada.

which ranged 3.36–71.66 ft³/s (A. Cairns, Environmental Manager, Constantine North Inc., Vancouver, personal communication).

CNI's 2008–2014, 2017–2021 Glacier Creek year-round basic water quality data documents total suspended solids ranging 3–2,470 mg/L, turbidity ranging 0.03–2,760 nephelometric turbidity units (NTU), and pH ranging 6.59–8.33 (DOI 2016; A. Cairns, Environmental Manager, Constantine North Inc., Vancouver, personal communication).

The lower 1 km of Glacier Creek (Stream No. 115-32-10250-2077-3151) provides habitat for coho salmon *O. kisutch*, cutthroat trout *O. clarkii*, and Dolly Varden char (Giefer and Blossom 2021). We captured Dolly Varden char while opportunistically sampling fish use 2016–2021; in October 2019, we documented one pair of adult coho salmon; in 2020 we captured one rainbow trout; and in 2021 we captured an adult cutthroat trout during aquatic biomonitoring and an adult coho salmon during the October survey.^{d,e,f,g,h,i} Further upstream in the drainage, we captured Dolly Varden char 0.6 km upstream of the Christmas Creek confluence, a nonglacial tributary located 4.5 km upstream of the Glacier Creek confluence with the Klehini River; previously, Tetra Tech (2013) and ADF&G documented the upper extent of Dolly Varden char below the Christmas Creek confluence. In 2018, we sampled fish use near the upper extent of Glacier Creek and did not find fish.^j

We sampled two locations in Glacier Creek: Lower Glacier Creek and Middle Glacier Creek (Figure 2).

Figure 2.—Glacier Creek sample site map.

Lower Glacier Creek

The Lower Glacier Creek sample site is located at the former Glacier Creek bridge near 230 m elevation, about 1.5 km upstream of the Klehini River (Table 1; Figure 3). We accessed the site from the old bridge crossing at the end of Porcupine Road and received transport across the creek with a helicopter due to high flows.

Lower Glacier Creek is a medium glacial outwash channel, which exhibit high rates of aggradation and scour resulting in active channels that move throughout the floodplain (Paustian 2010). Streambed gradient ranges 1–5% and the substrate is composed of cobble, gravel, sand, and silt. In 2021, we sampled a 490 m reach, a larger reach than most sample years due to high water and fewer suitable fish sampling areas available; we collected periphyton, benthic macroinvertebrate, and sediment samples in channel braids and along the main channel margin upstream of the old crossing, and fish primarily above the old crossing with one captured below. We observed young-of-year Dolly Varden char (20–30 mm FL) while electrofishing, which suggests successful spawning occurred near the site last fall. We also captured one adult cutthroat trout (260 mm FL).

Comparing stream characteristics of the Lower Glacier Creek sample site 2016–2021, we observed different main channel courses and channel braids each year. In 2021, upstream of the old bridge, the main channel flowed down the river left side of the floodplain with a few established braids on river right side which converged at the old bridge abutment. Downstream of the abutment, the main channel flowed on the river right side of the floodplain, with a braid flowing along river left.

Table 1.–2021 Lower Glacier Creek sample site location.

	Latitude	Longitude
Upper extent	59.4156	-136.3076
Lower extent	59.4179	-136.3003

Note: WGS84 datum.

Figure 3.–Lower Glacier Creek, looking downstream from the top of the sampling reach.

Middle Glacier Creek

The Middle Glacier Creek sample site is located near 350 m elevation, about 4.5 km upstream of the Klehini River (Table 2; Figure 4). We accessed the site by hiking from the access road.

Middle Glacier Creek also is characterized as a medium glacial outwash channel (Paustian 2010). Streambed gradient ranges 4–8% and the substrate is composed of cobble, gravel, sand, and silt. In 2021, we sampled a 444 m reach from the Christmas Creek confluence downstream, similar in size to the 2020 sample year due to high water level and fewer suitable fish sampling areas available. We collected periphyton, benthic macroinvertebrate, and sediment samples in channel braids and along the main channel margin, and fish throughout the sample reach.

Comparing stream characteristics of the Middle Glacier Creek sample site 2016–2021, we observed different main channel courses and channel braids each year. In 2021, the main channel shifted to the river right since sampling last year, which intercepted Christmas Creek where it flows into the Glacier Creek floodplain. Streamflow was concentrated in a main channel that meandered from river right to left in the floodplain in the sample reach and we were unable to cross the river.

Table 2.–2021 Middle Glacier Creek sample site location.

	Latitude	Longitude
Upper extent	59.4010	-136.3435
Lower extent	59.4036	-136.3379

Note: WGS84 datum.

Figure 4.–Middle Glacier Creek flowing along the river right bank intercepting Christmas Creek.

METHODS

Data sets are reviewed annually to ensure accuracy and consistency with modifications to methods; corrections and updates are reported in the document and appendices. The most recent technical report presents the current data sets and should be used to analyze data from previous years.

WATER QUALITY

Basic water quality data were collected with a Hanna HI98194; the instrument was calibrated per the manufacturer's instructions prior to sampling. The Hach 2100P Portable Turbidimeter was malfunctioning in the field and we were unable to obtain turbidity measurements. Historical data are provided in Appendix A.

PERIPHYTON: CHLOROPHYLL DENSITY AND COMPOSITION

Periphyton is composed of primary producing organisms, such as algae, cyanobacteria, and heterotrophic microbes, and detritus attached to the submerged surfaces of aquatic ecosystems. Algal density and community structure are influenced by water and sediment characteristics through physical, chemical, and biological factors, and disturbances that change throughout the year (Barbour et al. 1999).

Periphyton is sampled in Lower and Middle Glacier Creek to estimate algal density and community composition at each site, using concentrations of chlorophylls *a*, *b*, and *c*. The concentration of chlorophyll *a* (Chl-*a*) pigment in periphyton samples provides an estimate of active algal biomass (density), while concentrations of chlorophyll *b* (Chl-*b*) and chlorophyll *c* (Chl-*c*) pigments estimate the composition of algal organisms present, such as green algae that produce Chl-*b*, and diatoms and brown algae that produce Chl-*c*. The chlorophyll data are used to document baseline primary productivity.

Sample Collection and Analysis

Sampling methods are adapted from Barbour et al. (1999). Ten smooth, flat, undisturbed, and perennially wetted rocks were collected from submerged cobble in riffle habitats in less than 0.45 m water depth at each sample site and submerged in the creek in the same orientation they were collected. To collect a sample from each rock, a 5 × 5 cm square of high-density foam was held on the sample area; the area around the foam was scrubbed with a toothbrush to remove algae and other organisms outside the sample area. The rock was rinsed by submerging it in the stream while holding the foam in place; the toothbrush also was rinsed in the stream.

A 47 mm diameter Type A/E 1 μm glass fiber filter was placed into a Nalgene® filter receptacle attached to a vacuum pump with a gauge. The foam square was removed and the underside of the foam and the sample area were gently scrubbed in a circular pattern with the toothbrush into the filter receptacle. Stream water in a wash bottle was used to rinse loosened periphyton from the foam, rock, toothbrush, and the inside of the filter receptacle onto the filter. The sample area was scrubbed a second time and the rinse cycle was repeated. With most of the water pumped through the filter, maintaining pressure less than 34 kPa, a few drops^k of saturated magnesium carbonate solution was added to the filter^l before the sample was pumped dry. The glass fiber filter was

^k This measurement is not exact as the amount of water and MgCO₃ used to create a saturated solution varies and does not affect sample integrity; supernatant solution was used to avoid MgCO₃ solids.

^l To prevent acidification and conversion of chlorophyll to phaeophytin.

removed from the receptacle, folded in half with the sample inside, and wrapped in a white coffee filter for additional moisture absorption. The samples were placed in a sealed, labeled plastic bag with desiccant and stored in a light-proof cooler containing frozen icepacks during transportation; samples were stored in a -20°C freezer in the ADF&G Douglas laboratory until processing.

U.S. Environmental Protection Agency (EPA; 1997) protocol was followed for chlorophyll extraction and measurement, determining instrument and estimated detection limits, and data analysis.^m Samples were removed from the freezer, cut into small pieces, and placed into individual 15 mL screw cap centrifuge tubes containing 10 mL of 90% buffered acetone. The centrifuge tubes were capped and shaken to ensure complete submersion of the sample. Secured in a vial rack covered with aluminum foil, the samples were stored in a refrigerator for 12–24 hours to allow for saturation and chlorophyll extraction.

The samples were centrifuged for 20 min at 500 relative centrifugal force. Prior to sample measurement, two cuvettes containing 90% buffered acetone were placed into a Shimadzu UV-1800 spectrophotometer to calibrate absorbance of the solvent at wavelengths 664 nm, 647 nm, 630 nm, and 750 nm. Each sample supernatant was decanted into an individual cuvette and absorbance was measured at each wavelength. Each sample was treated with 80 µL of 0.1 N hydrochloric acid for 90 seconds to convert the chlorophyll to phaeophytin, and absorbance was measured at wavelengths 665 nm and 750 nm. To minimize stray light and improve resolution, sample cuvettes were cleaned with a nonabrasive wipe prior to placement in the spectrophotometer.

Trichromatic equations were used to estimate Chl-*a*, Chl-*b*, and Chl-*c* concentrations, correcting for turbidity using the 750 nm absorbance value (APHA 2012, EPA 1997). Chl-*a* concentrations were corrected when phaeophytin was detected. When Chl-*a* was not detected in a sample, the concentration is reported as the spectrophotometer estimated detection limit and the values for Chl-*b* or Chl-*c* are excluded. The 2021 estimated detection limit for Chl-*a* concentration was 0.29 mg/m².

Data Presentation

For each site and by year, mean Chl-*a*, Chl-*b*, and Chl-*c* densities are presented in a table, Chl-*a* sample densities in a figure, and mean proportions of Chl-*a*, Chl-*b*, and Chl-*c* in a figure. A comparison of mean Chl-*a* densities among sites also is presented in a figure. The 2016–2021 sample density data are provided in Appendix B.

BENTHIC MACROINVERTEBRATE DENSITY AND COMMUNITY COMPOSITION

Benthic macroinvertebrates (BMI) classified in the orders Ephemeroptera (mayflies), Plecoptera (stoneflies), and Trichoptera (caddisflies), collectively known as EPT taxa, have complex and short life cycles and many genera are sensitive to changes in water and sediment quality (Barbour et al. 1999). These organisms are secondary producers, feed upon periphyton and other macroinvertebrates, and provide a food source for fish.

^m Deviations from EPA (1997) include sample storage longer than 3.5 weeks, and cutting sample filters to reduce acetone exposure for laboratory staff (as opposed to homogenization).

Sample Collection and Analysis

Six BMI samples were collected from each site using a Surber stream bottom sampler in riffles and runs with gravel and cobble substrate and varying flow velocities—habitats that support greater BMI densities and taxonomic richness (Barbour et al. 1999). Other habitat types (e.g., pools) were excluded to reduce data variability.

The Surber stream bottom sampler has a 0.093 m² sample area and material is captured in a 200 mL cod end, both constructed with 300 µm mesh net. After securing the frame on the streambed with the opening facing the upstream current, rocks within the sample area were scoured with a scrub brush; gravel, sand, and silt were disturbed to about 10 cm depth to dislodge macroinvertebrates into the net. The net was rinsed in the stream to ensure all organisms drifted into the cod end, and each sample was transferred from the cod end to a labeled 500 mL plastic bottle. Samples were preserved in 95% ethanol at a ratio of three parts ethanol to one part sample. Samples exceeding the capacity of the cod end were discarded in the field to minimize detritus and substrate in samples and ensure proper sample preservation.

The samples were processed with an elutriator system with a 0.3 mm sieve to sort macroinvertebrates from debrisⁿ and organisms were identified to the lowest practical taxonomic level^o using Merritt and Cummins (1996) and Stewart and Oswood (2006). Quality control of benthic macroinvertebrate enumeration was completed for two samples.

BMI density was calculated for each sample by dividing the number of macroinvertebrates by 0.093 m²—the Surber sampling area. Mean density was estimated for each site by calculating the mean density among the six samples. Taxa richness is reported as the number of taxonomic groups identified to the lowest practical level; terrestrial^p organisms were excluded from all calculations.

Data Presentation

For each site and by year, a table is presented summarizing mean BMI density, total taxa, total EPT taxa, percent EPT insects, and percent Chironomidae insects. BMI densities and community composition are illustrated in figures and BMI density and taxa richness data comparisons among sites also are presented. The 2021 sample data and the 2016–2021 data summaries are provided in Appendix C.

RESIDENT FISH CONDITION

Age, sex, season, maturation, diet, gut contents, fat reserve, and muscular development affect fish condition. Length and weight data were used to assess fish condition—an index of fish health.

Sample Collection and Analysis

Resident Dolly Varden char FL was recorded to the nearest 1 mm and weight to the nearest 0.1 g. Fulton's condition factor (*K*) was calculated using the equation given in Anderson and Neumann

ⁿ Gordon Willson-Naranjo and Greg Albrecht, Habitat Biologists, to Jackie Timothy, Southeast Regional Supervisor, ADF&G Division of Habitat. Memorandum: Benthic macroinvertebrate elutriation trials amendment; dated 12/17/2013. Unpublished document can be obtained from the Southeast Regional Supervisor, ADF&G Habitat Section, 802 3rd St, Douglas, AK.

^o Insects of the orders Ephemeroptera, Plecoptera, Trichoptera, and Diptera to genus, except nonbiting midges to family Chironomidae, and all others to class or order. Damaged and degraded organisms that cannot be identified are not reported.

^p Including adult terrestrial insects of the orders Ephemeroptera, Plecoptera, Trichoptera, and Diptera.

(1996), where the weight (W) of each fish is divided by the cubed length (L), and the product multiplied by 100,000:

$$K = \frac{W}{L^3} \times 100,000$$

Data Presentation

For each site the mean fish condition factor of Dolly Varden char is presented and compared among sites; 2016–2020 data are provided in Appendix D.

RESIDENT FISH ELEMENT CONCENTRATIONS

Element bioavailability and bioaccumulation depends on physical and chemical factors and interactions among biological communities (Tchounwou et al. 2012). Similar to other studies in Alaska (Legere and Timothy 2016), resident Dolly Varden char samples from Lower and Middle Glacier Creek were analyzed for whole body concentrations of silver (Ag), arsenic (As), cadmium (Cd), copper (Cu), mercury (Hg), lead (Pb), selenium (Se), and zinc (Zn) to document baseline concentrations and variability. These elements were selected based on CNI’s Glacier Creek water sample data and potential target elements identified in the ore body.

Sample Collection and Analysis

Fish were captured using a Smithroot LR-24 backpack electrofisher and 10 resident Dolly Varden char were retained.^{9,†} The target size range for sample retention was fish measuring 90–130 mm FL, as other Southeast Alaska Dolly Varden char sampling programs require (Timothy and Kanouse 2014, Legere and Timothy 2016, Kane 2021). A 90 mm fish provides the minimum weight requirement for laboratory testing, while a 130 mm fish is 2–3 years old and young enough to reasonably conclude it is resident due to sampling timing and location—about 60 km upriver from Chilkat Inlet. Due to general scarcity of fish at both sample sites, all fish captured were retained as samples regardless of size between 2016 and 2019; the sampling reach extent also was contingent on capture efforts each year. In 2020, we discontinued submitting composite samples of two smaller fish due to dilution needed to process samples at the lab resulting in greater method reporting limits. However, in some years we retained larger fish to obtain a minimum of five samples per site.

Wearing latex gloves, each fish was placed in an individually labeled plastic bag. During transport, samples were stored in a cooler with frozen icepacks and in a freezer while onsite. At the ADF&G Douglas laboratory, FL and weight were measured in the sample bags, correcting for bag weight. Samples were stored in a -20°C freezer in the lab until shipped to a private lab for analyses.

Samples were shipped to ALS Environmental in Kelso, WA in a cooler with frozen icepacks via overnight freight, maintaining written chain of custody documentation. ALS Environmental measured total concentrations of Ag, As, Cd, Cu, Hg, Pb, Se, and Zn in each sample on a dry-weight basis, following EPA (2002) method 1631E for Hg, and EPA (1998) method 6020A^s for

⁹ In 2016 and 2019, baited minnow traps also were used to capture fish in Lower Glacier Creek.

[†] In 2017, 2018, and 2020, only six samples were retained from Middle Glacier Creek; in 2021, only five samples were retained due to scarcity of fish.

^s In 2016, 2018, and 2019, the same lab used EPA method 200.8 (EPA 1994).

the other elements. The laboratory provided Tier IV quality control information including results for sample duplicates, matrix spikes, standard reference materials, and blanks.

Data Presentation

For each site and by year, Dolly Varden char whole body element concentrations are presented in a figure; comparisons of element concentrations data among sites also are presented. A table with the raw data, presenting the mean value for duplicate sample results and 2021 laboratory report are in Appendix D.

In 2018, the lab reported greater Ag and As method reporting limits than previous years, largely due to underweight samples (K. Clarkson, Senior Project Manager, ALS Environmental, Kelso, personal communication). Therefore, to avoid misrepresenting sample results below method reporting limits as whole body element concentrations data, element concentrations undetected are illustrated as an empty circle (°) at the method reporting limit, while measured element concentrations are illustrated as a solid circle (•).

SEDIMENT ELEMENT CONCENTRATIONS

Sediment element concentrations are influenced by a variety of factors, such as geochemical composition and weathering within the watershed, sediment grain size, organic content, and development (Tchounwou et al. 2012). Subsequently, sediment element concentrations influence aquatic productivity. Fine sediments were sampled at Lower and Middle Glacier Creek for total organic carbon, acid volatile sulfide, and total concentrations of Ag, aluminum (Al), As, Cd, Cu, iron (Fe), Hg, Pb, Se, and Zn to document baseline conditions and variability. These elements were selected based on CNI's Glacier Creek water sample data and potential target elements identified in the ore body.

Sample Collection and Analysis

Wearing latex gloves, five samples were collected from sand/silt bars within actively flowing channels and retained the top 4 cm of sediment in glass jars for element analyses and plastic bags for particle size analyses. Samples were stored in a cooler with frozen icepacks in the field and in a hotel refrigerator while in Haines. On June 23, 2021, CNI staff transported the sediment samples in coolers with ice packs via a courier to ALS Environmental in Whitehorse, BC.

ALS Environmental measured total organic carbon, acid volatile sulfide, and total Ag, Al, As, Cd, Cu, Fe, Hg, Pb, Se, and Zn concentrations on a dry-weight basis using methods listed in Table 3.^t The laboratory provided quality control results for laboratory controls and blanks.

^t The 2016 Glacier Creek sediment samples were processed by an ALS Environmental lab in Kelso, WA. In 2017–2020, CNI sent the sediment samples to a different ALS lab; though methods used by each lab were different, the results are comparable. The parameters analyzed were different between labs; data comparisons between years are presented where applicable.

Table 3.–2021 sediment tests, analytes, and methods.

Test Description	Analyte	Method
Particle size distribution	Particle size determination	ASTM D6913-04/D7928-16
Total organic carbon calculation	Total organic carbon	CSSS (2008) 21.2
Total Carbon by combustion method	Total carbon	CSSS (2008) 21.2 (mod)
Mercury in soil by CVAAS	Hg	EPA 200.2 / 1631 Appendix (mod)
Inorganic carbon as CaCO ₃ equivalent	Inorganic carbon	Calculation
Metals in soil by CRC ICPMS	Ag, Al, As, Cd, Cu, Fe, Pb, Se, and Zn	EPA 6020B (mod)
Sulfide, acid volatile	Acid volatile sulfides	EPA 821/R-91-100 (mod)

Data Presentation

For each site and by year, sediment element concentrations data are presented in a figure; mean values are reported when sample duplicate data are available. Consistent with the whole body Dolly Varden char element concentration data presentations, sediment element concentrations undetected are illustrated as an empty circle (°) at the method reporting limit and a solid circle (•) for measured element concentrations.

The data are compared with the threshold effects concentrations (TEC) and the probable effects concentrations (PEC) for inorganics in freshwater sediment guidelines developed by the National Oceanic and Atmospheric Administration (Buchman 2008). The guidelines are based on results of controlled laboratory bioassays, where element concentrations below the TECs rarely affect aquatic life survival and growth, and element concentrations above the PECs can affect aquatic life survival and growth.

Sediment element concentrations data are compared among sites and presented as a figure. Appendix E contains the 2016–2021 composition and raw element data in a table and the 2021 laboratory report.

RESULTS

LOWER GLACIER CREEK

We sampled Lower Glacier Creek on June 16, 2021, and measured basic water quality at 1245 hours (Table 4).

Table 4.–Lower Glacier Creek water quality data.

Sample Date	Temperature (°C)	Dissolved Oxygen (mg/L)	Conductivity (μS/cm)	pH
06/16/21	5.12	ND ^a	207	8.20

^a Measurements were far lower than anticipated, suggesting an error in the unit.

Periphyton: Chlorophyll Density and Composition

The 2021 Lower Glacier Creek mean Chl-*a* density was 0.77 mg/m², within the range of the 2016–2020 mean densities (Table 5; Figure 5). The samples contained about 75% Chl-*a*, 23% Chl-*c*, and about 2% Chl-*b* (Figure 6); the greatest proportion of Chl-*c* observed. Chl-*a*, Chl-*b*, and Chl-*c* were not detected in 4 samples.

Table 5.–Lower Glacier Creek mean chlorophylls *a*, *b*, and *c* densities.

Sample Date	Chl- <i>a</i> (mg/m ²)	Chl- <i>b</i> (mg/m ²)	Chl- <i>c</i> (mg/m ²)
06/07/16	2.27	0.00	0.35
06/08/17	1.73	0.00	0.26
05/30/18	1.25	0.02	0.24
06/06/19	0.43	0.01	0.04
06/03/20	3.91	0.00	0.47
06/16/21	0.77	0.02	0.24

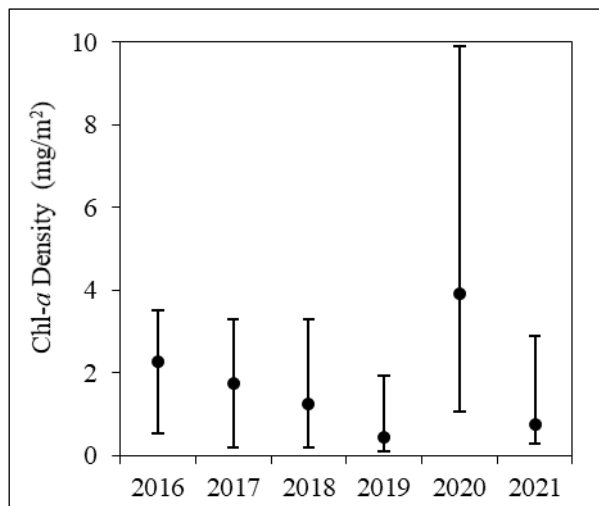

Figure 5.–Lower Glacier Creek chlorophyll *a* densities.

Note: Minimum, mean, and maximum values shown.

Figure 6.–Lower Glacier Creek mean proportions of chlorophylls *a*, *b*, and *c*.

Benthic Macroinvertebrate Density and Community Composition

Among the 2021 Lower Glacier Creek BMI samples, we identified 26 taxa and estimated mean density at 396 BMI/m², of which 27% were EPT insects (Table 6; Figures 7, 8). The dominant taxon was Diptera: Chironomidae, representing 58% of the samples, as in previous years.

Table 6.—Lower Glacier Creek benthic macroinvertebrate data summaries.

	06/07/16	06/08/17	05/30/18	06/06/19	06/03/20	06/16/21
Mean BMI density (per m ²)	995	2,136	217	473	754	396
Total BMI taxa	17	30	16	12	25	26
Number of EPT taxa	9	13	10	5	12	12
Proportion of EPT insects	10%	17%	69%	30%	19%	27%
Proportion of Chironomidae insects	85%	78%	26%	67%	74%	58%

Figure 7.—Lower Glacier Creek benthic macroinvertebrate densities.

Note: Minimum, mean, and maximum values shown.

Figure 8.—Lower Glacier Creek mean benthic macroinvertebrate community compositions.

Resident Fish Condition and Element Concentrations

Of the 10 individual whole body Dolly Varden char (100–149 mm) samples we retained from Lower Glacier Creek in 2021, mean fish condition was 1.1, similar to previous years. We captured one adult cutthroat trout (260 mm FL) while sampling—the first adult trout captured during aquatic biomonitoring. Among the Lower Glacier Creek whole body Dolly Varden char samples in 2021 all element concentrations were within the ranges of values previously observed (Figure 9).

Figure 9.—Lower Glacier Creek whole body Dolly Varden char element concentrations.

Note: Element concentrations undetected (o) are presented at the method reporting limit.

Sediment Composition and Element Concentrations

The 2021 Lower Glacier Creek sediment samples included particle sizes less than 9.5 mm. Total organic carbon concentrations were less than 0.440%, and acid volatile sulfide was not detected. The predominant elements were Fe and Al, and the 2021 element concentrations generally were similar to the 2016–2020 results.

We evaluated the 2021 sediment sample element concentration data against the guidelines for freshwater sediments published in Buchman (2008) and—similar to the 2016–2020 results—we found Cd, Cu, and Zn concentrations near or above the TEC values, and As, Hg, and Pb concentrations below the TEC values (Figure 10).

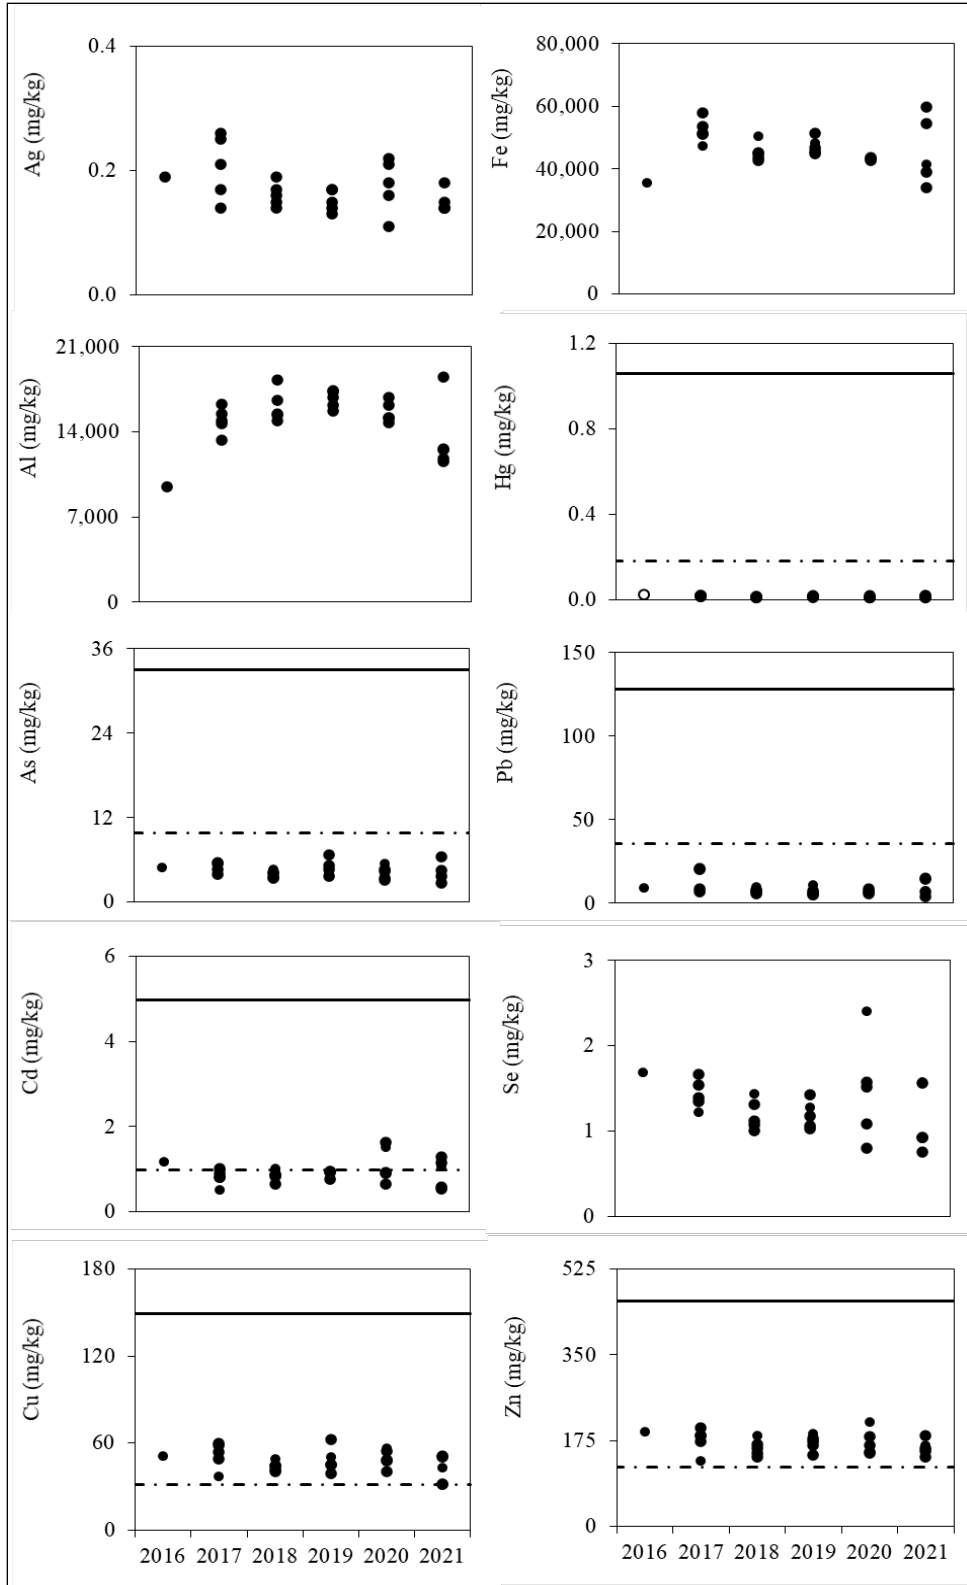

Figure 10.—Lower Glacier Creek sediment element concentrations.

Note: Element concentrations undetected (o) are presented at the method reporting limit. The dashed line represents the TEC and the solid line represents the PEC for freshwater sediments (Buchman 2008); guidelines are not published for Ag, Al, Fe, or Se.

MIDDLE GLACIER CREEK

We sampled Middle Glacier Creek on June 15, 2021, and measured basic water quality at 1200 hours (Table 7).

Table 7.—Middle Glacier Creek water quality data.

Sample Date	Temperature (°C)	Dissolved Oxygen (mg/L)	Conductivity (µS/cm)	pH
06/15/21	2.59	ND ^a	197	7.98

^a Measurements were far lower than anticipated, suggesting an error in the unit.

Periphyton: Chlorophyll Density and Composition

The 2021 Middle Glacier Creek mean Chl-*a* density was 2.03 mg/m², greater than the 2016–2020 sample means (Table 8; Figure 11). As in previous years, the samples contained about 85% Chl-*a* and 15% Chl-*c*; 1 sample contained a low concentration of Chl-*b* (Figure 12). Chl-*a*, Chl-*b*, and Chl-*c* were not detected in 1 sample.

Table 8.—Middle Glacier Creek mean chlorophylls *a*, *b*, and *c* densities.

Sample Date	Chl- <i>a</i> (mg/m ²)	Chl- <i>b</i> (mg/m ²)	Chl- <i>c</i> (mg/m ²)
06/08/16	1.50	0.00	0.25
06/09/17	0.81	0.00	0.10
05/31/18	1.76	0.00	0.29
06/07/19	0.33	0.01	0.04
06/02/20	1.19	0.01	0.16
06/15/21	2.03	0.00	0.25

Figure 11.—Middle Glacier Creek chlorophyll *a* densities.

Note: Minimum, mean, and maximum values shown.

Figure 12.—Middle Glacier Creek mean proportions of chlorophylls *a*, *b*, and *c*.

Benthic Macroinvertebrate Density and Community Composition

Among the 2021 Middle Glacier Creek BMI samples, we identified 27 taxa and estimate mean density at 842 BMI/m², of which 33% were EPT insects (Table 9; Figures 13, 14). The dominant taxon was Diptera: Chironomidae, representing 57% of the samples, as in previous years.

Table 9.—Middle Glacier Creek benthic macroinvertebrate data summaries.

	06/08/16	06/09/17	05/31/18	06/07/19	06/02/20	06/15/21
Mean BMI density (per m ²)	2,299	593	504	215	754	842
Total BMI taxa	22	14	12	11	25	27
Number of EPT taxa	12	6	5	8	13	11
Proportion of EPT insects	13%	12%	9%	28%	24%	33%
Proportion of Chironomidae insects	85%	82%	87%	68%	69%	57%

Figure 13.—Middle Glacier Creek benthic macroinvertebrate densities.

Note: Minimum, mean, and maximum values shown.

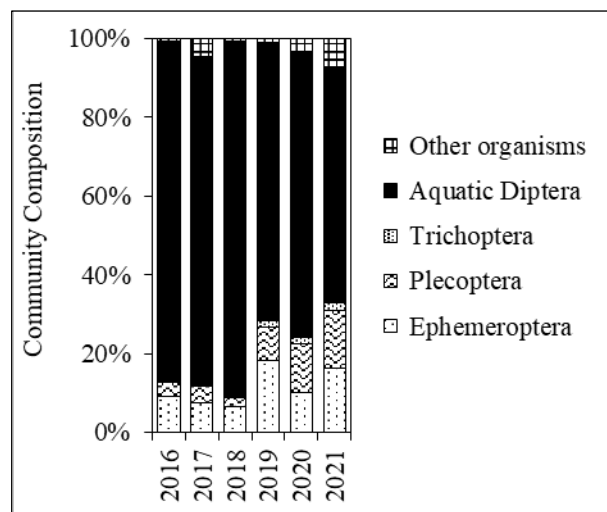

Figure 14.—Middle Glacier Creek mean benthic macroinvertebrate community compositions.

Resident Fish Condition and Element Concentrations

Of the 5 individual whole body Dolly Varden char (135–163 mm) samples we retained from Middle Glacier Creek in 2021, mean fish condition was 1.3. We did not capture other fish species while sampling. The 2021 whole body Dolly Varden char element concentrations generally were similar to concentrations observed in 2016–2020.

Figure 15.—Middle Glacier Creek whole body Dolly Varden char element concentrations.

Note: Element concentrations undetected (o) are presented at the method reporting limit.

Sediment Composition and Element Concentrations

The 2021 Middle Glacier Creek sediment samples included particle sizes less than 9.5 mm. Total organic carbon concentrations were less than 0.320%, and acid volatile sulfide was not detected. The predominant elements were Fe and Al, and the 2021 element concentrations generally were similar to the 2016–2020 results.

We evaluated the 2021 sediment sample element concentration data against the guidelines for freshwater sediments published in Buchman (2008) and—similar to the 2016–2020 results—we found Cd, Cu, and Zn concentrations near or above the TEC values, and As, Hg, and Pb concentrations below the TEC values (Figure 16).

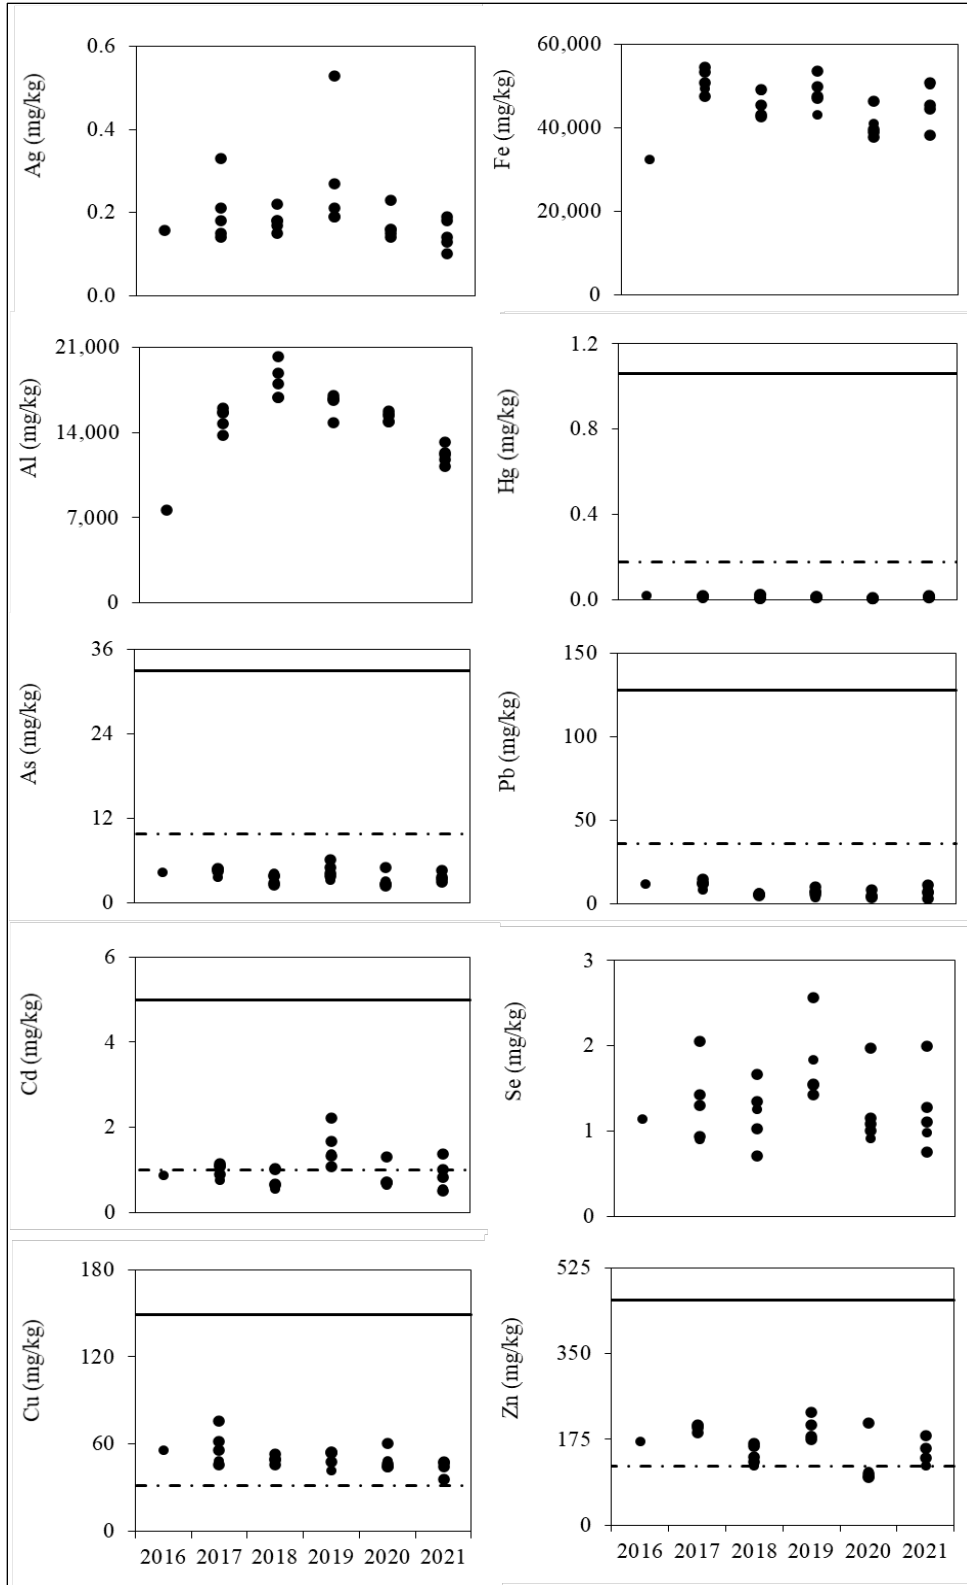

Figure 16.–Middle Glacier Creek sediment element concentrations.

Note: Element concentrations undetected (o) are presented at the method reporting limit. The dashed line represents the TEC and the solid line represents the PEC for freshwater sediments (Buchman 2008); guidelines are not published for Ag, Al, Fe, or Se.

COMPARISON AMONG SITES

Periphyton: Chlorophyll Density and Composition

In 2021, the Middle Glacier Creek mean Chl-*a* density was greater than the Lower Glacier Creek mean density, and greater than previously observed at the site (Figure 17). The 2021 Lower Glacier Creek mean Chl-*a* density was within the range observed at the site 2016–2020, similar to the 2019 mean which was the lowest observed. The 2021 Lower Glacier Creek periphyton samples contained a greater proportion, (23%), of Chl-*c* than previously observed; Middle Glacier Creek periphyton samples contained about 85% Chl-*a* and 15% Chl-*c*, similar to previous years.

Figure 17.—Glacier Creek chlorophyll *a* densities.

Benthic Macroinvertebrate Density and Community Composition

In 2021, we documented BMI density and taxa richness at Lower Glacier Creek within the range 2016–2020 (Figures 18, 19). At Middle Glacier Creek, the 2021 mean BMI density was within the 2016–2020 range, however taxa richness was the greatest observed. Diptera: Chironomidae insects were the dominant taxon at both sites in 2021, as in most previous years.

Figure 18.–Glacier Creek mean benthic macroinvertebrate densities.

Figure 19.–Glacier Creek benthic macroinvertebrate taxa richness.

Resident Fish Condition and Element Concentrations

Mean fish condition among the 2021 Lower and Middle Glacier Creek Dolly Varden char samples was 1.1 and 1.3 at each site, similar to the 2016–2020 results and other Dolly Varden char condition data collected in Southeast Alaska (Kane 2021).

When we combined the 2016–2021 Dolly Varden char element concentration data by site, median element concentrations were greater among the Lower Glacier Creek samples, except median Ag and As concentrations were similar as those elements are often not detected (Figure 20). All concentrations were within the ranges observed in whole body Dolly Varden char samples collected from reference and exploration sites elsewhere in Alaska (Legere and Timothy 2016).

Figure 20.—Glacier Creek whole body Dolly Varden char element concentrations, 2016–2021.

Note: Median (♦), minimum, and maximum concentrations presented; element concentrations not detected are included at the method reporting limit.

Sediment Composition and Element Concentrations

The 2016–2021 Lower and Middle Glacier Creek sediment samples were largely composed of sand and silt; total organic carbon was less than 0.5% and acid volatile sulfide was detected in one sample. When we combined the 2016–2021 sediment element concentration data by site, median element concentrations were generally similar among sites (Figure 21).

We evaluated the element concentration data against the guidelines for freshwater sediments published in Buchman (2008), and similar to the 2016–2020 results found Cd, Cu, and Zn concentrations near or above the TEC values, and As, Hg, and Pb concentrations below the TEC values at both sites (Figure 21). Guidelines are not published for Ag, Al, Fe, or Se.

Figure 21.—Glacier Creek sediment element concentrations, 2016–2021.

Note: Median (♦), minimum, and maximum concentrations presented; element concentrations not detected are included at the at the method reporting limit.

Note: The dashed line represents the TEC and the solid line represents the PEC for freshwater sediments (Buchman 2008); guidelines are not published for Ag, Al, Fe, or Se.

APPENDIX A: WATER QUALITY DATA

Appendix A.1.–Lower Glacier Creek water quality data, 2016–2021.

Sample Date	Temperature (°C)	Dissolved Oxygen (mg/L)	Conductivity (µS/cm)	Turbidity (NTU)	pH
06/07/16	3.3	12.6	115	126	6 ^a
06/08/17	6.5	13.6	129	306	8.32
05/30/18	5.8	10.8	161	17	8.15 ^b
06/06/19	6.6	12.4	133.6	11	6.76 ^c
06/03/20	5.74	12.02	233	17	7.85
06/16/21	5.12	ND	207	ND	8.20

^a We used a colorpHast pH indicator strip with 0.5 unit sensitivity.

^b Taken by Allegra Cairns on 6/2/2018.

^c Taken by Allegra Cairns on 6/8/2019.

Appendix A.2.–Middle Glacier Creek water quality data, 2016–2021.

Sample Date	Temperature (°C)	Dissolved Oxygen (mg/L)	Conductivity (µS/cm)	Turbidity (NTU)	pH
06/08/16	3.1	14.1	129	57	6 ^a
06/09/17	3.1	16.7	113	> 1000	8.38
05/31/18	4.1	11.3	182	16	ND
06/07/19	4.0	18.0	126	94	ND
06/02/20	3.44	13.3	246	23	8.14
06/15/21	2.59	ND	197	ND	7.98

^a We used a colorpHast pH indicator strip with 0.5 unit sensitivity.

RE: 2021 Palmer Project Biomonitoring

Dear Dylan,

Enclosed are the results of the sample(s) submitted to our laboratory August 19, 2021
For your reference, these analyses have been assigned our service request number **K2109749**.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3376. You may also contact me via email at Mark.Harris@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Mark Harris
Project Manager

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated value.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.
- H The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

- # The control limit criteria is not applicable. See case narrative.
- J The result is an estimated value.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
 - i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.
- Q See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimated value.
- J The result is an estimated value.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
 - i The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.

Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/analyte is offered by that state.

Client: Alaska Department of Fish and Game
Project: 2021 Palmer Project Biomonitoring
Sample Matrix: Animal Tissue, Water

Service Request: K2109749
Date Received: 08/19/2021 - 09/21/2021

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples for the Tier level IV requested by the client.

Sample Receipt:

Seventeen animal tissue, water samples were received for analysis at ALS Environmental on 08/19/2021 - 09/21/2021. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at minimum in accordance with the analytical method requirements.

Metals:

Method 6020A, 09/24/2021: Method Blank KQ2118162-01 contained low levels of Copper above the Method Reporting Limit (MRL). The concentration of Copper in all of the associated field samples was greater than ten times the amounts measured in the Method Blank so no additional corrective action was required.

Zinc	6020A	0.5	0.08	134	129	132	4	20

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

ALS Environmental

CERTIFICATE OF ANALYSIS

Work Order : **WR2100682** Page : 1 of 8

Amendment : **1**

Client : **Constantine North Inc.** Laboratory : **Whitehorse - Environmental**

Contact : **Dylan Krull** Account Manager : **Carla Fuginski**

Address : **Suite 320 - 800 West Pender St.** Address : **#12 151 Industrial Road**

Telephone : **Vancouver BC Canada V6C 2V6** Telephone : **Whitehorse YT Canada Y1A 2V3**

Project : **907-465-6160** Date Samples Received : **+1 867 668 6689**

PO : **Palmer Project** Date Analysis Commenced : **23-Jun-2021 21:15**

C-O-C number : **----** Issue Date : **28-Jun-2021**

Sampler : **17-773584** Issue Date : **27-Oct-2021 12:23**

Site : **DK**

Quote number : **Sediment Analysis**

No. of samples received : **Q62329**

No. of samples analysed : **10**

No. of samples analysed : **10**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	Position	Laboratory Department
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Janice Leung	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Maria Painchaud	Laboratory Assistant	Inorganics, Saskatoon, Saskatchewan
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia
Ophelia Chiu	Department Manager - Organics	Organics, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Xihua Yao	Laboratory Analyst	Inorganics, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
 LOR: Limit of Reporting (detection limit).

Unit	Description
-	No Unit
%	percent
µmol/g	micromole per gram
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Workorder Comments

Laboratory control standard recovery data is not available for acid volatile sulfide analysis of samples #1-10. Acceptable positive control results are available from the 'matrix spike', and associated sample recoveries are not impacted.

Qualifiers

Qualifier	Description
DUPH	Duplicate results outside ALS DQO, due to sample heterogeneity.

Work Order : **WR2100682**

Amendment : 1

Client : **Constantine North Inc.**

Contact : Dylan Krull

Address : Suite 320 - 800 West Pender St.

Vancouver BC Canada V6C 2V6

Telephone : 907-465-6160

Project : Palmer Project

PO : ---

C-O-C number : 17-773584

Sampler : DK

Site : Sediment Analysis

Quote number : Q62329

No. of samples received : 10

No. of samples analysed : 10

Laboratory : Whitehorse - Environmental

Account Manager : Carla Fuginski

Address : #12 151 Industrial Road

Whitehorse, Yukon Canada Y1A 2V3

Telephone : +1 867 668 6689

Date Samples Received : 23-Jun-2021 21:15

Issue Date : 27-Oct-2021 12:23

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO: Data Quality Objective.

LOR: Limit of Reporting (detection limit).

RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Matrix Spike outliers occur.
- Duplicate outliers occur - please see following pages for full details.
- Laboratory Control Sample (LCS) outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers occur - please see following pages for full details.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Soil/Solid**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Duplicate (DUP) RPDs								
Metals	WR2100682-005	2021 LGC S5	cadmium	7440-43-9	E440	57.6 % DUP-H	30%	Duplicate RPD does not meet the DQO for this test.
Metals	WR2100682-005	2021 LGC S5	lead	7439-92-1	E440	51.8 % DUP-H	40%	Duplicate RPD does not meet the DQO for this test.
Metals	WR2100682-005	2021 LGC S5	mercury	7439-97-6	E510	0.0104 % DUP-H	Diff <2x LOR	Low Level DUP DQO exceeded (difference > 2 LOR).

Result Qualifiers

Qualifier Description

DUP-H Duplicate results outside ALS DQO, due to sample heterogeneity.

Laboratory Control Sample (L-CS) Recoveries

Metals	QC-MRG2-2335420 02	----	aluminum	7429-90-5	E440	76.7 % MES	80.0-120%	Recovery less than lower control limit
Metals	QC-MRG2-2339580 02	----	aluminum	7429-90-5	E440	77.2 % MES	80.0-120%	Recovery less than lower control limit

Result Qualifiers

Qualifier Description

MES Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.
 Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Soil/Solid** Evaluation: * = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type	Method	QC Lot #	Count			Frequency (%)		Evaluation
			QC	Regular	Actual	Expected		
Analytical Methods								
Laboratory Duplicates (DUP)								
Acid Volatile Sulfide by Colourimetry (5 mg/kg)	E396	232091	1	10	10.0	5.0	✓	
Loss On Ignition (550°C)	E205D	235713	1	10	10.0	5.0	✓	
Mercury in Soil/Solid by CVAAS	E510	233542	3	28	10.7	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
pH by Meter (1:2 Soil:Water Extraction)	E108 Vancouver - Environmental	Soil/Solid	BC Lab Manual	pH is determined by potentiometric measurement with a pH electrode at ambient laboratory temperature (normally 20 ± 5°C), and is carried out in accordance with procedures described in the BC Lab Manual (prescriptive method). The procedure involves mixing the dried (at <60 °C) and sieved (10mesh/2mm) sample with ultra pure water at a 1:2 ratio of sediment to water. The pH is then measured by a standard pH probe.
Moisture Content by Gravimetry	E144 Vancouver - Environmental	Soil/Solid	CCME PHC in Soil - Tier 1	Moisture is measured gravimetrically by drying the sample at 105°C. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of the sample, expressed as a percentage.
Particle Size Analysis - Sieve >2mm	E181 Saskatoon - Environmental	Soil/Solid	ASTM D6913-04	Soil samples are disaggregated and sieved through a 2mm sieve. Material retained on the sieve is then further sieved through a series of sieves. The amount passing through the sieves is measured gravimetrically.
Particle Size Analysis - Sieve <2mm	E182 Saskatoon - Environmental	Soil/Solid	ASTM D6913-04	Soil samples are disaggregated and sieved through a 2mm sieve. Material passed through the sieve is then further disaggregated using calgon solution and passed through a series of sieves. The amount passing through the sieves is measured gravimetrically.
Particle Size Analysis - Hydrometer	E183 Saskatoon - Environmental	Soil/Solid	ASTM D7928-16	Soil material is separated from coarse material (>2mm). A specimen is then disaggregated through mixing with Calgon solution. The material is then suspended in solution wherein regular hydrometer readings are taken at specific time intervals. The principles of Stokes' Law are applied to determine the amount of material remaining in solution as well as the maximum particle size remaining in solution at the specified time.
Grain Size Report (Attachment) Hydrometer/Sieve Method	E185 Saskatoon - Environmental	Soil/Solid	ASTM D6913/D7928	A grain size curve is a graphical representation of the particle sizing of a sample representing the percent passing against the effective particle size.
Loss On Ignition (550°C)	E205D Saskatoon - Environmental	Soil/Solid	CSSS (2008) 28.3 (mod)	Loss On Ignition (LOI) is determined by drying a portion of an air dried and ground sample at 105°C overnight, then igniting at 550°C for 16-20 hours. The weight loss after ignition is reported as % loss on ignition. LOI is reported on a dry weight basis. LOI at 550°C can be used as an estimation of Organic Matter (CSSS 2008).
Total Carbon by Combustion	E351 Saskatoon - Environmental	Soil/Solid	CSSS (2008) 21.2 (mod)	Total Carbon is determined by the high temperature combustion method with measurement by an infrared detector.
Acid Volatile Sulfide by Colourimetry (5 mg/kg)	E396 Vancouver - Environmental	Soil/Solid	EPA 821/R-91-100 (mod)	Acid Volatile Sulfide is determined by colourimetric measurement on a sediment sample that has undergone distillation. Evolved hydrogen sulfide gas trapped and analyzed by the methylene blue colourimetric method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Metals in Soil/Solid by CRC ICPMS	E440 Vancouver - Environmental	Soil/Solid	EPA 6020B (mod)	This method is intended to liberate metals that may be environmentally available. Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl. Dependent on sample matrix, some metals may be only partially recovered, including Al, Ba, Be, Cr, Sr, Ti, V, W, and Zr. Silicate minerals are not solubilized. Volatile forms of sulfur (including sulfide) may not be captured, as they may be lost during sampling, storage, or digestion. Elemental Sulfur may be poorly recovered by this method.
Simultaneously Extracted Metals by CRC ICPMS (mg/kg)	E449 Vancouver - Environmental	Soil/Solid	EPA 821/R-91-100; EPA 6020B (mod)	Analysis is by Collision/Reaction Cell ICPMS. This analysis is carried out in accordance with the method described in EPA 821/R-91-100. Hydrochloric acid is added to samples within a purge and trap system. The extract produced from the addition of the acid is then analyzed for simultaneously extracted metals (SEM) using Collision/Reaction Cell ICPMS.
Mercury in Soil/Solid by CVAAS	E510 Vancouver - Environmental	Soil/Solid	EPA 200.2/1631 Appendix (mod)	Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl, followed by CVAAS analysis.
Simultaneously Extracted Mercury by CVAAS	E519 Vancouver - Environmental	Soil/Solid	EPA 821/R-91-100/1631E (mod)	An extract of sediment sample that has been treated with hydrochloric acid within a purge and trap system is analyzed by CVAAS.
Total Organic Carbon (Calculated) in soil	EC356 Saskatoon - Environmental	Soil/Solid	CSSS (2008) 21.2	Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon (TIC).
Acid Volatile Sulfide by Colourimetry (µmol/g)	EC396 Vancouver - Environmental	Soil/Solid	EPA 821/R-91-100 (mod)	Calculation for Acid Volatile Sulfide to convert units to µmol/g
Simultaneously Extracted Metals by CRC ICPMS (µmol/g)	EC449 Vancouver - Environmental	Soil/Solid	EPA 821/R-91-100/EPA 6020B (mod)	This analysis is carried out in accordance with the method described in EPA 821/R-91-100. Hydrochloric acid is added to samples within a purge and trap system. The extract produced from the addition of the acid is then analyzed for simultaneously extracted metals (SEM) using Collision/Reaction Cell ICPMS.
Simultaneously Extracted Mercury by CVAAS (µmol/g)	EC519 Vancouver - Environmental	Soil/Solid	EPA 821/R-91-100/1631E (mod)	An extract of sediment sample that has been treated with hydrochloric acid within a purge and trap system is analyzed by CVAAS.
Preparation Methods				
Leach 1:2 Soil:Water for pH/EC	EP108 Vancouver - Environmental	Soil/Solid	BC WLAP METHOD: PH, ELECTROMETRIC, SOIL	The procedure involves mixing the dried (at <60°C) and sieved (No. 10 / 2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water.

Preparation Methods		Method / Lab	Matrix	Method Reference	Method Descriptions
Distillation for Acid Volatile Sulfide in Soil		EP396 Vancouver - Environmental	Soil/Solid	EPA 821/R-91-100 (mod)	Sample distillation for Acid Volatile Sulfide analysis.
Digestion for Metals and Mercury		EP440 Vancouver - Environmental	Soil/Solid	EPA 200.2 (mod)	Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl. This method is intended to liberate metals that may be environmentally available.
Simultaneously Extracted Metals Preparation		EP495 Vancouver - Environmental	Soil/Solid	EPA 821/R-91-100	This analysis is carried out in accordance with the method described in EPA 821/R-91-100. Hydrochloric acid is added to sediment samples within a purge and trap system. The extract produced from the addition of the acid is then analyzed for simultaneously extracted metals (SEM) and Mercury.
Preparation of Samples for AVS and Metal Sulfide Determination		EPP396 Vancouver - Environmental	Soil/Solid	APHA 4500S2J	Sediment samples are treated with hydrochloric acid within a purge and trap system, where the evolved hydrogen sulfide gas is carried into a basic solution by argon gas for analysis.
Dry and Grind		EPP442 Saskatoon - Environmental	Soil/Solid	Soil Sampling and Methods of Analysis, Carter 2008	After removal of any coarse fragments and reservation of wet subsamples a portion of homogenized sample is set in a tray and dried at less than 60°C until dry. The sample is then particle size reduced with an automated crusher or mortar and pestle, typically to <2 mm. Further size reduction may be needed for particular tests.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percentage Difference

= Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Qualifiers

Qualifier	Description
DUP-H	Duplicate results outside ALS DQO, due to sample heterogeneity.
J	Duplicate results and limits are expressed in terms of absolute difference.

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DOO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Soil/Solid**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: Soil/Solid

Analyte	CAS Number	Method	LOR	Unit	Concentration	Laboratory Control Sample (LCS) Report			Qualifier

Qualifiers

Qualifier Description

MES

Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level $\geq 1 \times$ spike level.

Sub-Matrix: **Soil/Solid**

Laboratory sample ID	Client sample ID	Analyte	CAS Number	Method	Spike		Recovery (%)		Recovery Limits (%)		Qualifier
					Concentration	Target	MS	Low	High		
Inorganic Parameters (QCLot: 232091)											
WR2100682-002	2021 LGC S2	sulfides, acid volatile	----	E396	191 mg/kg	200 mg/kg	100	70.0	130	---	---

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix: **Soil/Solid**

PARTICLE SIZE DISTRIBUTION CURVE

BOULDERS	COBBLES	GRAVEL		SAND SIZES			SILT	CLAY
		COARSE	FINE	COARSE	MEDIUM	FINE		

METHOD DESCRIPTION

Method Reference: ASTM D 422 - 63 (2002)

Dispersion method: Mechanical

Dispersion period: 1 minute cm/s

Soil classification system used: ASTM D422-63 Classification

DESCRIPTION OF SAND AND GRAVEL PARTICLES

Shape: Angular

Hardness: Hard

SUMMARY OF RESULTS

GRAIN SIZE	WT %	DIA. RANGE (mm)
% GRAVEL :	<1	> 4.75
% COARSE SAND :	<1	2.0 - 4.75
% MEDIUM SAND :	4.01	0.425 - 2.0
% FINE SAND :	63.89	0.075 - 0.425
% SILT :	28.69	0.075 - 0.005
% CLAY :	3.39	< 0.005
