QA/QC	Quality Assurance and Quality Control
SEP	Supplemental Environmental Program
TAK	Teck Alaska, Inc.
WMCI	Water Management Consultants, Inc.

1 Introduction

The Long-Term Permafrost and Groundwater Monitoring Program (the Monitoring Program) was established as an outcome of the Supplemental Environmental Project (SEP) and the Consent Decree between Cominco Alaska, Inc. (now Teck Alaska Incorporated) and the United States Environmental Protection Agency (EPA), entered into on November 25, 1997 (US v. Cominco Alaska Incorporated, Civil Action A97-267CV). The Monitoring Program was developed to monitor the potential effects of the Tailings Impoundment on permafrost and groundwater in the areas of the tailings Main Dam, Overburden Stockpile, and background locations downgradient of the Tailings Impoundment within the Red Dog Creek and Bons Creek drainages. The Consent Decree requires the submission of an annual report to provide a data collection summary, a quality assurance and quality control (QA/QC) summary, and a description of the status of the monitoring program.

A review of the data from 2020 did not show any significant changes in permafrost depths or groundwater elevations in the area of the Tailings Impoundment Facility. Improved quality checks and maintenance are resulting in improved data acceptance.

2 Background

The Red Dog Mine is a lead-zinc mine located in northwestern Alaska approximately 50 miles northeast of Kotzebue, Alaska and 107 miles north of the Arctic Circle within the DeLong Mountains. The mine is owned by NANA Regional Corporation and operated by Teck Alaska (TAK). Figures 1 and 2 illustrate the regional setting and layout of the mine and its support facilities. As illustrated on Figure 2, the mine consists primarily of ore bodies that have been mined (open pits) and associated support facilities. Support facilities include an ore milling and a concentration facility, an employee housing area, a construction camp, an asphalt paved runway, and a power generation facility. The site also includes approximately 300 acres of waste rock piles and a tailings pond (impoundment) behind two earthen dams. The pond is used for storage of tailings and receives drainage from the open pit areas, natural surface run-off, and process waters from the milling operation. Following treatment, water is discharged from the pond during summer months pending upstream water quality considerations. The original Red Dog ore body is no longer being actively mined and is instead receiving waste rock from the mining of the Aqqaluk ore body.

The tailings pond has the potential to affect both permafrost and groundwater in one or more adjacent watersheds/drainages. To document these potential effects, a ground temperature and groundwater level monitoring program began in the mid-1990s as part of the Groundwater Monitoring Supplemental Environmental Project (SEP). Results from this project are documented in the project's report (Water Management Consultants, Inc. 2001) and form the basis for the Long-Term Permafrost and Groundwater Monitoring Plan. Long-term monitoring is intended to demonstrate the continuity of the permafrost and the minimal flow of groundwater beneath and from the impoundment pond. The continuity of subsurface frozen conditions is critical to ensuring that any impacts from dissolved metals in the impoundment do not affect the adjacent watersheds.

The key elements of the Monitoring Program are:

- The quarterly monitoring of sixteen thermistors at background sites, overburden stockpile, and main dam area;
- The quarterly monitoring of nine piezometers at background sites and main dam area;
- Data reduction, presentation, and management;
- Annual data reporting; and,
- Assessment of data trends on a five-year basis.

3 2020 Data Collection

TAK personnel collect the data from the project thermistors and piezometers. This data is then emailed to Kuna Engineering (Kuna). Appendix B contains a table of the raw data. Kuna is then responsible for the data reduction, presentation, and management.

The Red Dog Mine thermistor and piezometer monitoring locations are illustrated on Figure 3 (northern portion), Figure 4 (central portion), and Figure 5 (southern portion).

Table 1 provides a summary of the quarterly data collection dates for the thermistor strings, and Table 2 provides a summary of the quarterly data collection dates for the piezometers.

Notes: Hyphens (-) indicate that data was not collected.
* Indicates that no barometric data was available/listed.
** Indicates inaccurate readings.

4 Data Management and Reporting

As previously described, for 2020, the reading and collection of the data from the thermistors and piezometers was performed by TAK personnel. This data was periodically provided to Kuna to upload to the Red Dog Mine groundwater monitoring database. Microsoft Access™ and Excel™ software are used to generate the tables and graphical plots of the data.

4.1 Thermistor Data Collection

Data collected from the thermistor cables is measured as a resistance value, in kilo-ohms (kohms) using a Dryden Instrumentation T5KMUK Automated Thermistor String Reader. The measured resistance values are subsequently converted to temperatures using calibration coefficients for each thermistor sensor. A calibrated digital temperature acquisition cable was used to measure ground temperature at replacement site T-14-110. All measured values are reviewed for errors and omission, and then uploaded to the database.

Some thermistor measurements are not representative of true/valid measurements (i.e., where the measurements are less than zero (0) kohms or greater than 300 kohms). These measurements may also represent issues with the sensors or cable breaks/shorts. These measurements are not uploaded to the database. The out-of-range values are shaded red in the raw data table presented in Appendix B.

4.2 Piezometer Data Collection

As with the thermistor readings, TAK personnel are responsible for providing the measurements from the vibrating wire piezometers and the associated barometric pressure readings from the mine meteorological station. The vibrating wire transducer measurements are then converted by Kuna to groundwater elevations using the individual transducer calibration coefficients, site elevations, and barometric pressure readings. The calibration coefficients for each of the vibrating wire transducers was determined during installation. Following conversion and a quality control review, the 2020 data was uploaded to the database.

4.3 Data Analyses

The ground temperature measurements collected from the sixteen thermistor monitoring locations are graphed using three types of graphs/plots as presented in Appendix C (separate plots for each thermistor string):

- Temperature trumpet plots of data for all years (separate color for each year/quarter);
- Temperature plots of data for the 2020 data according to depth (for each quarter of measurements); and
- Average temperature plots of the 2020 data according to depth.

For each graph, the measurements are presented as auto range and scale limited. The auto range plots represent the validated measurements (i.e., those not eliminated as described previously). For visual clarity, scale limited plots only include data within a limited range and excludes most outliers. Note the outliers are individual nodes that are likely caused by intermittent connections and therefore do not represent true changes in temperature at depth.

The piezometer (groundwater elevation) data is presented in Appendix D as time series graphs.

5 Summary of Data QA/QC and Data Considerations

Copies of the quarterly report data checklists are provided in Appendix E, with the quarterly data field reporting forms. The checklists are completed by Kuna following the receipt of the quarterly data and sent back to TAK personnel to enable the recollection of data as necessary. Standard operating procedures developed for the monitoring program included taking duplicate measurements to ensure different operators and or equipment would not impact representativeness of the data.

According to the consent decree, a full analysis and interpretation of the data will be provided in the next 5-year monitoring report.

5.1 Thermistor QA/QC

Duplicate measurements were collected from the Dryden Instruments T5KMUK data logger and the Dryden Switchbox Fluke multimeter system. Variations in the thermistor measurements were also compared to previously collected data and trends. The thermistor QA/QC data is presented in Table 3.

Table 3 Summary of 2020 Thermistor QA/QC Data

Quarter	Date	Thermistor	Multi-meter Start Time	Comments
1st Quarter	-	-	-	Not recorded
2nd Quarter	4/26/20	T-96-21	-	
3rd Quarter	7/14/20	T-96-22	1510 hours	Nodes 3, 8, 15 are bad.
4th Quarter	10/19/20	T-95-4	1641 hours	Node 1 is jumpy

5.2 Piezometer QA/QC

Table 4 presents a summary of the QA/QC data for the piezometer readings; duplicate measurements of the P-96-13 piezometer were recorded in the 3rd quarter of 2020.

Table 4 Summary of 2020 Piezometer QA/QC Data

Quarter	Date	Piezometer	Comments
1st Quarter	-	-	Not recorded
2nd Quarter	-	-	Not recorded
3rd Quarter	7/14/20	P-96-13	Value 6582.1
4th Quarter	-	-	Not recorded

5.3 Thermistor System Maintenance

The thermistor measurements from 2020 indicate that several are malfunctioning and require replacement or repair. Shorts or discontinuities may also exist in the cabling/wiring for each thermistor at certain depths. Out-of-range readings may be indicative of these issues.

A program is currently in place to replace the surface connector cables (a common point of failure), as needed.

5.4 Piezometer System Maintenance

Most of the vibrating wire transducers are functioning, with limited erroneous measurements. Negative readings from early 2020 from piezometer P96-013 are potentially attributed to frozen conditions that may have been present in the thermistor. Piezometer SPP-97-002 developed an unknown error resulting in significantly higher groundwater elevation measurements.

Notes:

Num of Therms = total number of thermistor sensors at each site (string)

Date/Time = mm/dd/yy hh:mm

Measurements are shown in kohms. *T14-110 measurements are in Celsius

Red highlighted data represent measurements that are outside of database criteria and omitted from the database.

Appendix C
Thermistor Plots

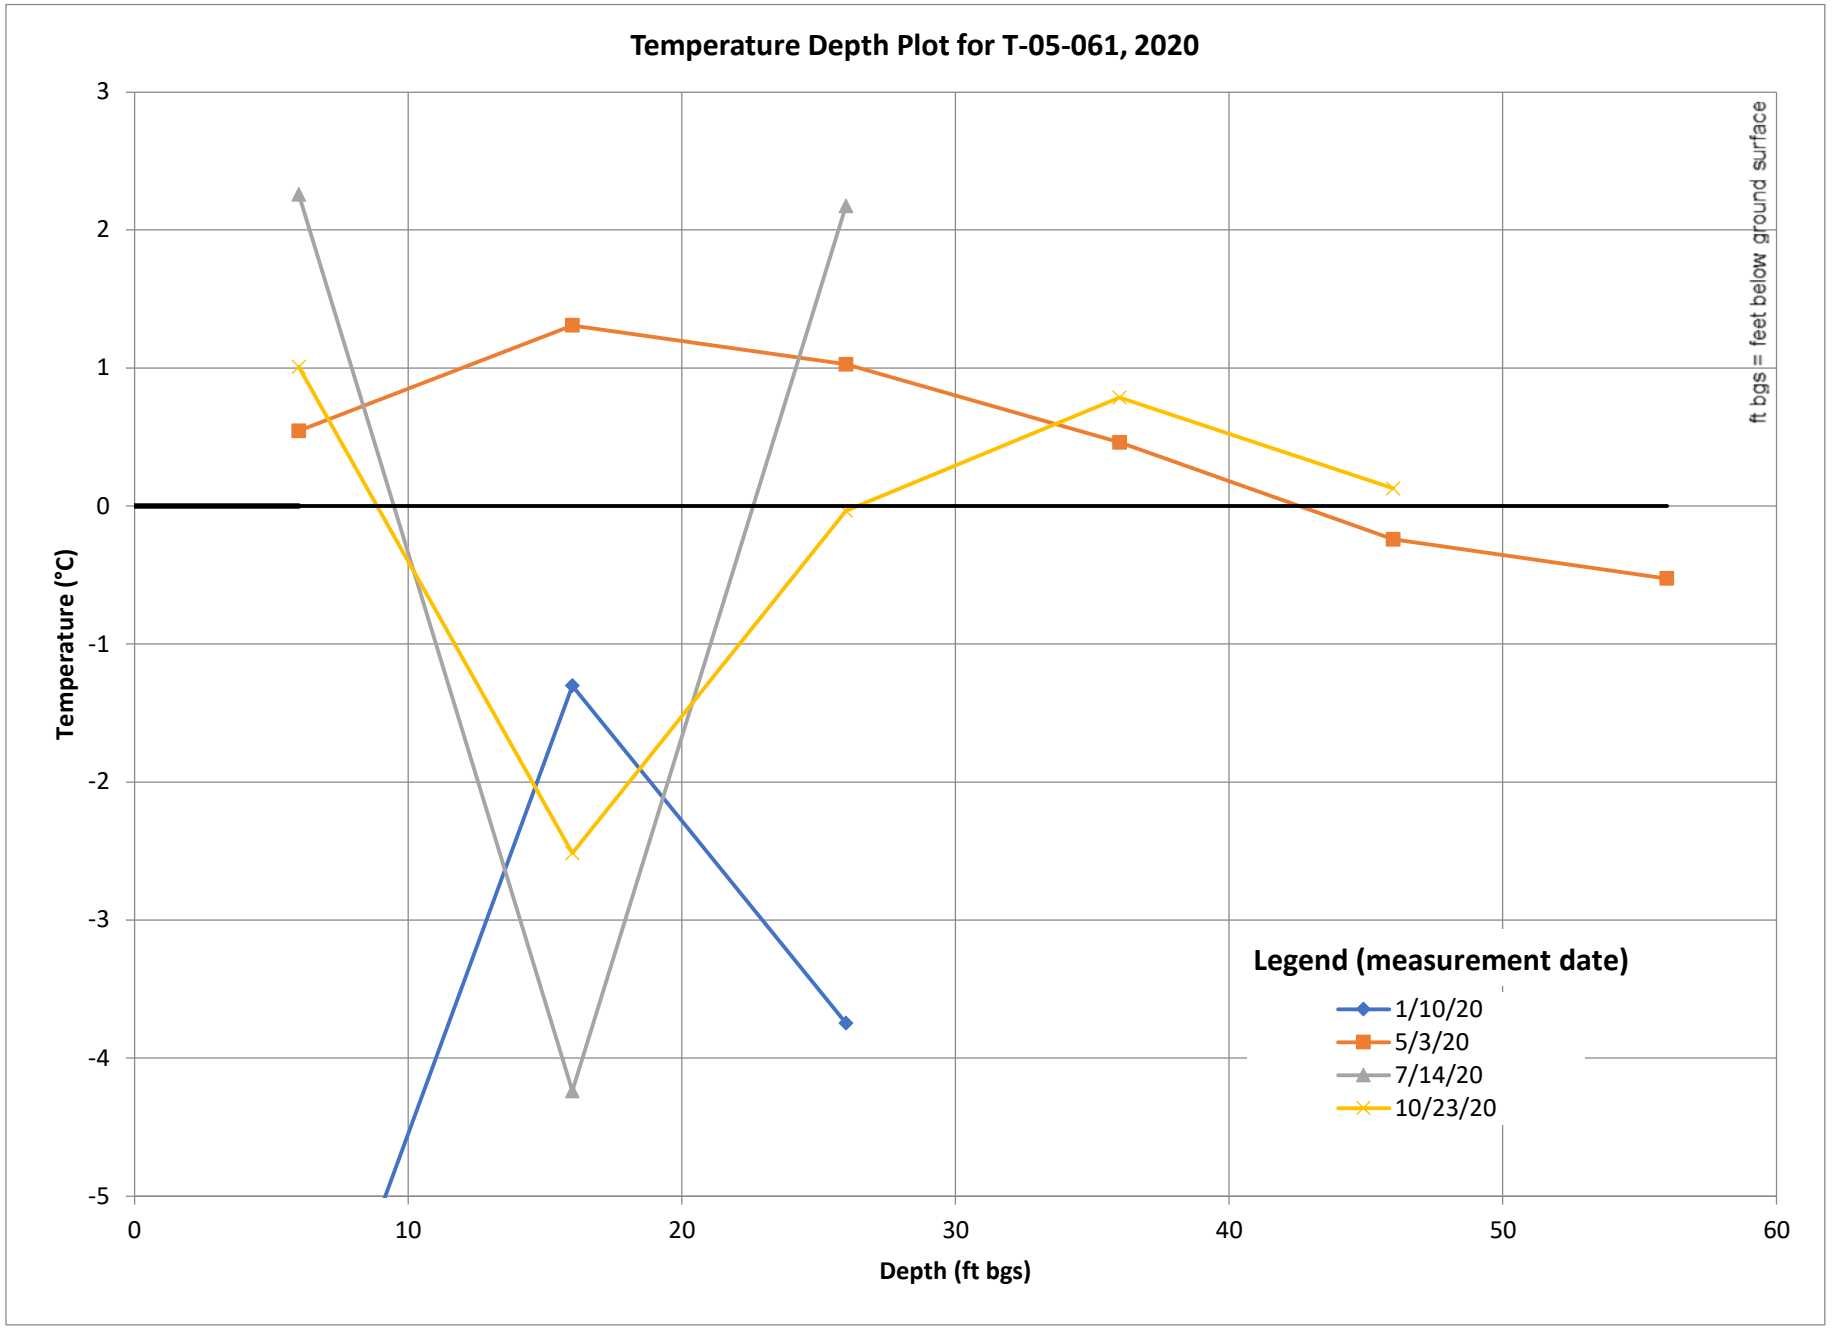

3 plots per thermistor:

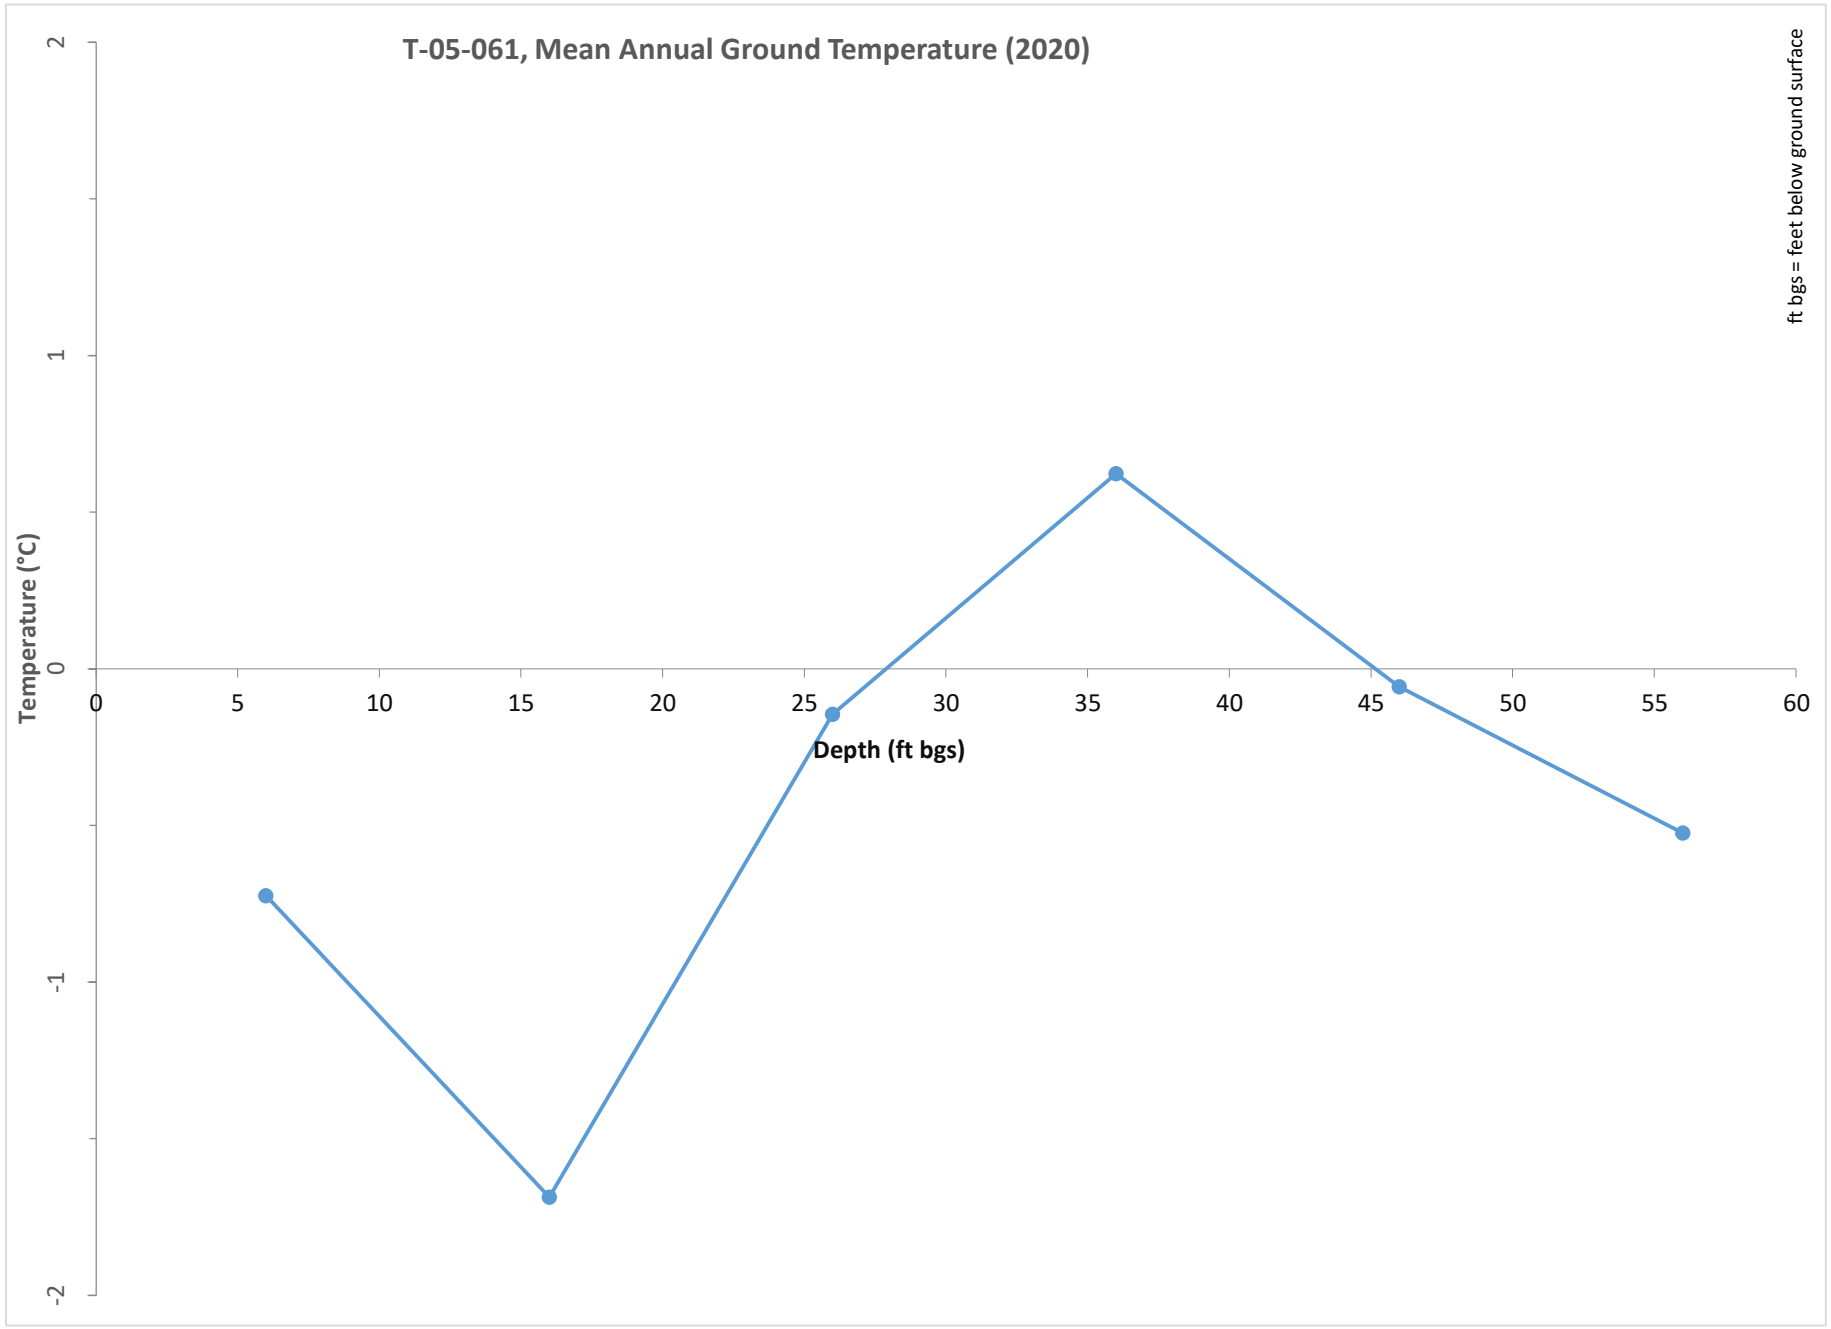

- 2020 quarterly temperatures vs. depth
- 2020 average temperature vs. depth
- Cumulative temperature vs. depth (by quarter)

KUNA QUARTERLY REPORT DATA CHECKLIST **Quarter** Q1 2020 **Date** 04/07/2020

For Teck/RedDog Longterm Groundwater and Permafrost monitoring

☐ **YES / NO** Quarterly data received from Teck. Date received: 01/16/2020

☐ **YES / NO** Data received for 16 Thermistors

☐ **YES / NO** Data received for 9 Piezometers

☐ **YES / NO** QA/QC Forms received for both Thermistors and Piezos

☐ **YES / NO** Is data complete for all Thermistors? If "No" make note of data gaps:

_____

☐ **YES / NO** Is data complete for all Piezometers? If "No" make note of data gaps:

_____

☐ **YES / NO** Field Notes for the Quarter. Are data gaps/irregularities addressed?

Additional Comments: The barometric pressure was listed as mBar which is not consistent with prior readings in the past.
