1. SUMMARY

1.1. Introduction

The 2013 mine plan was completed in June 2012. The following initial assumptions of the 2013 mine plan have changed dramatically during this several month period of mine development:

- Change in 2012 final pit status from EOY 2012 predictions made in June. The 850, 875, 1075 and 1050 benches were all behind the EOY predictions. The 950 bench was behind on the east side, while the west side of the bench had already removed shots planned for Q1 2013.
- 2) Water issues have required the dumping sequence be modified to delay waste dumping into the flooded Main Pit. There is uncertainty about where waste dump locations will be for Q2 to Q4 2013. All options will increase the cycle time for haul trucks.
- Capping the Main Waste Dump to prevent water infiltration requires additional "sponge" type waste in Q1 and Q2, and additional loader and haul truck hours.
- 4) Three 777s that were scheduled to be decommissioned have been kept on site to support additional capital projects, primarily the MWD capping and the main dam/back dam/wing wall raises. The decommissioning of the 7th and 8th operating 777s will also be delayed, because the longer waste hauls require more truck hours to achieve production.
- 5) The Aqqaluk block model has been updated from Red 2010D to Red 2012. The Red 2012 model does not currently incorporate data from the blasthole assays of previously drilled shots.

This 2013 Mine Plan Addendum is a collection of revised monthly 2013 mine production plans, equipment forecasts, dumping plans and other major changes.

1.2. Mine Production

The production target forecast has been reset to 11,746 kt of total mine production from the Aqqaluk Pit (Table 1-1). The 3,620 kt of ore at 17.3% Zn and 4.1% Pb is from Aqqaluk Pit throughout 2013. There are 8,126 kt of waste scheduled from the Aqqaluk Pit.

	Aqqaluk Pit	Total
Total (t)	11,746,244	11,746,244
Ore (t)	3,619,752	3,619,752
Zn (%)	17.3	17.3
Pb (%)	4.1	4.1
Waste (t)	8,126,492	8,126,492
SR	2.25	2.25

 Table 1-1
 2013 Mine Plan Summary

The comparison between the Amended Plan, 2013 Budget and 5-year mine plan are in Table 1.2.

	1-Year Mine Plan	1-Year Mi	ne Plan vs. 5-1	(ear Plan	1-Year Mi	ne Plan vs. 20 [°]	13 Budget
ltem	2013	5-Year (2013)	Difference	% Variance	Budget (2013)	Difference	% Variance

Table 1-2 Comparison to Budget and 5-Year Plan

1.3. Equipment Fleets

The adjusted 2013 equipment schedule is shown in Table 1-2. The fleet size for the blasthole drills, productions loaders and dozers remains the same throughout 2013. The overall fleet size for operating 777 haul trucks will remain at 8 through 2013. One operating 777 will be parked from April to October while haul truck hours shift to capital 777 trucks, primarily utilized by the dam raising project. The capital haul trucks were scheduled to be decommissioned and shipped off site in 2012, but were kept on site to provide equipment for the new and expanding projects related to tailings and water management. These trucks can only be used on capital projects.

Equipment	Description	Jan. to Mar.	April	May. to Aug.	Sep.	Q4
Drills	DML	3	3	3	3	3
Operating Trucks	777	8	7	7	7	8
Capital Trucks	777	1	2	3	1	0
Loaders	992/993	5	5	5	5	5
Dozers	D9/D10	4	4	4	4	4

Table 1-3 2013 Equipment Schedule

1.4. Haul Access

The overall goal for access is to have full width (90 ft.) two lane 777 haul roads, with reasonable grades (10-12%) on the most direct route possible between the active mining benches and the haul destinations, the ore stockpile and the waste dumps. Two access points to each mining bench are preferred, though benches may have a single access in the short term while mining is progressing towards an area that will provide additional access.

For drop cuts, three of which are planned in 2013, the increased size of the 993 loaders has increased the required width to approximately 135 ft. For a 14 equilateral ore pattern, the closest match to this is a 133 ft. blast perimeter width.

1.5. Risks and Opportunities

1) Aqqaluk Pit Ore Reserves and Block Model Accuracy

The challenges of modeled ore tonnage and grade deviation will continue throughout 2013, but the block model update should reduce this deviation, particularly once blasthole assays are incorporated. There is a risk this update to Red 2012 model will cause significant changes to the ore/waste cutoff and ore grades. To mitigate this, the mine plan has shots planned on multiple benches, as well as different geologically similar areas, in each period. This strategy, combined with blasted inventory of at least 500 kt, maximizes flexibility for stockpile planning when blasthole assays vary from model predictions.

2) Type 8 Fine Grained Ore

The same strategy as above is used to mitigate the risk to metal recovery from Type 8 fine grained ore. While RDO geology does not have precise data on the location of this fine grained ore, the analysis of results from past stockpiles combined with geological observations in the field have identified a general area stretching diagonally through Aqqaluk pit from at least 950 bench to 875 bench. To minimize the negative effects of this ore, it is blended with other ore types in the stockpile.

3) Production Blasting

There are both risks and opportunities with mine blasting in 2013.

- There is an opportunity to improve ore fragmentation to improve mill throughput and decrease rock breaker hours. The target for 2013 is a 20% reduction in boulder management.
- The practice of double boosting each blasthole has eliminated hotholes in the pit.
- There is an opportunity with the change to the Orica blasting system to improve blast crew productivity, especially once we receive the Logger 500 that can log two and a half times as many holes as the current model.
 - 4) MWD Capping

The required timeline for capping the MWD storage pile is aggressive, and there is a risk of not achieving established deadlines because of issues with weather, equipment, manpower, or design.

5) Dam Lifts

The mining equipment hours required for the main dam, back dam, and wing wall raise projects are not precisely forecasted. For this plan, the hours projected for the original raise of just the main dam have been doubled. If the equipment hours increase significantly, there is a risk of insufficient equipment to complete the project while achieving planned mine production.

6) Major Haul Truck Maintenance

From April to August, when only 7 operating haul trucks are required to achieve the mine plan, there is an opportunity to complete major maintenance work on the extra haul truck.
